So just get a new motherboard with a faster CPU.

> I bought a AMD K6-2 333Mhz in november 98... it's already outdated, Win98 is very slow (opening a
> window is a very very slow process) and not stable

That's the fault of Win98, not your PC. Luckily for me, I ordered mine
when Win95 R2 was the default OS. I upgraded to Win98, then after awhile
uninstalled it and went back to 95. Win98 is especially slow if you
activate the Active Desktop features. Turn them off -- if you can! I also
ran into lots of Explorer crashes, which brought down the whole system
thanks to the foolish integration of browser and OS.

> I think I will sold very soon my PC and buy the Milan 060 or the iMac (MacOS X soon !!!)

Milan, cool. MacOS X ... yawn.

> Uhh ?!
> the iMac embodies the come back of Apple !

And that's a *good* thing? :-/

> And it innovates...

Innovates how? Just an ordinary Mac in a fancy case, with a tiny monitor
you can't upgrade, no way to improve its 3D game performance or really any
feature, since it's a closed case and difficult to access. And this is a
new wonder computer?

> what is innovating in a PC ? you have dozens of fucking cables,

Same thing in a blue G3. And at least you can change the monitor. :>

> incompatible
> drivers, a very huge system (200mo mini) and worse of all the CPU ! a old CISC ! compare an iMac 333
> emulating Win98 with Virtual PC with a PC 333mhz running Win98... YOU WILL CRY !

You will cry indeed if you try and emulate a PC running Half-Life, because
the iMac will turn in a very sorry performance and you'll say, 'For the
same price, I coulda had a PC that would rock all over this and be totally
upgradeable.' And with MacOS, should your internet connection take a long

time to complete (say, in excess of 40 seconds), lotsa luck trying to launch an entertaining MP3 or run a Quicktime movie to pass the time. Natch, this is no problem with the Amiga. :P

I confess to being stunned at the enthusiasm of Atarians for Macs. I've owned PMacs since '95 and I'm going to sell my last one soon, with no regrets.....

Which is not to say that PCs don't suck, too, but at least I can maintain my sanity thanks to my Amiga.

> sometimes you have to jump to a new standard

The Zip is a lousy standard. Zip disks can only be read by Zip drives,
which have proven to be unreliable. Much better to use the LS-120 super
floppy. For bigger back-ups, use a CD-Rewriter rather than some removable
hard drive like a Jaz. I bought a SyQuest SyJet a couple years back. I'm
not happy about it now. :<

> G3 power in itself isn't innovative, I agree, but such power at this price is innovative
(before
> only Atari and Amiga have done it)

Nah, Pentium2 400Mhz systems are diving into the under $1,000 range. Even
when the iMac was introduced, a comparable PC could be had for the same
price, or less, and you could upgrade it without having to string cables
all over your desk.

Maybe not dead, but whistling past the graveyard.....

There are not tons of new apps coming out for the Mac. There's hardly any native game developers, and very few ports. Thanks to an Atari programmer (Alexander Clauss) they finally have a native browser. Can you imagine how lame the Mac programming community must be that they've gone all this time using crippled ports of Netscape and IE? Have you ever used Netscape on a Mac? It's way slower than the PC version or any Amiga or PC browser, and it's incredibly unstable, fragments your memory, etc. etc.

What do MacHeads do for fun with their machines? There's no demo scene on the Mac, no MOD scene, very little in the way of level designing for games.

How can anyone even use a Mac on a 1024x768 screen or above, with that incredibly slow mouse? Do aftermarket mice ship with mouse accelerators? My MacAlly mouse didn't. The three-speed control panel in the OS just isn't good enough. The fastest setting is far too slow.

And then, of course, there's the Mac's famous multitasking......

> Chris (still saving up for a G3)

Save up for an AmigaNG. It'll be a lot cheaper. :>

> I have booted from both.

First, check that both drives have different SCSI ID numbers. The
bootable one normaly has ID #0.

Second, termination. Typically, the internal drive _should_ be
terminated, plus the last external device on the SCSI chain also.

Last, some recent drives use "initiator ID" which most drivers
cannot provide. HD-Driver handles those well, but they cannot
be used as the boot drive, only as secondary drives.

I hope this helps.

Ethernet Open Discussion Project

Seeing the lack of ethernet connectivity as a major drawback in using the Atari M68K machines and in view of the stalled SCSI-->Ethernet project, I'd like to propose a discussion on an ethernet solution based on massproduced ISA cards.

Karl Samyn has told me that there are people who can write the software drivers, which to me seems the biggest job. This discussion will be focused on hardware matters.

Anyone can join in and propose, criticize or correct in the discussion.

What's it good for?
Lots of things. One minimal requirement is that you have access to at least two computers, a solo network is a contradiction in terms...
A network means that you can share resources like printers, harddisks, modems, etc. Say that your family is all computerized. A PC is used by the kids to play games on. You're using your Atari for music production and your wife has another Atari for writing her novel. With a network all of you would have access to the PC:s harddisks, which means that harddisks for the ST:s wouldn't be necessary. Also the weird windows-only printer connected to the PC can now be used by both Ataris as well. All the family can surf the net at the same time, each on his/her own computer.

There are many more uses. An extreme computing project on the Linux platform is the Beowulf system. Beowulf networks a number of (differently equipped) computers into one "organism", to perform distributed computing tasks.

One such task could be to compute graphical manipulations to happen in realtime. A virtual picture is defined, say 1.000.000 pixels horizontally and 600.000 vertically. Say that the color depth is 32 bits and you get L-O-T-S of pixels to work with... Say that the computing time for one transition is 6 monts with one machine. With 6 machines it would be 1 month. With 60 machines it would be 3 days, etc etc.

(For anal types who'd want to remark that there are losses due to overhead, yes you're right. But I'm just trying to draw a picture here...)

Here are some starting points to begin with.

*Is there already a solution for the Amiga or Macintosh computers that could be easily adapted to the Atari hardware?

*Where to interface the ISA card? On the processor bus, on the cartridge port, on the DMA port? I vote for the processor bus, but all suggestions are

welcome.

*Which well-documented card (chip) to choose in the first place?
It is best to concentrate all efforts to one single type of card in the beginning. Later new drivers can be developed for other manufacturers.

*Ideally this solution would work on all the processors and bus speeds used by the various Atari models and their accellerator cards. Also this is supposed to be an unrestrained solution, that would give the same possibilities as on a PC. No stupid "parity disabled SCSI interface" or "almost SCSI, but not really, we call it ACSI", or "we delivered the printer port from one signal that the rest of the world has included". In other words no Tramiel cheapness!

*The information from this discussion is free and available to all, and so is the right/grant to use it for projects/products. If you're industrious and want to make a buck from producing cards/adaptors then go ahead! But you can't copyright the solutions emerged in this discussion to stop others from producing their own.

*My thought is that after a working prototype series is made to work we could dispose of the cumbersome ISA cards and produce a small (matchbox size) card that would easily fit inside any Atari. The Realtek card I have at home only needs the surface of a matchbox to fit its single chip and capacitors.

CONNECTION TO PROCESSOR BUS QUESTIONS:

*What about the Lo-byte Hi-byte issue concerning ISA cards on the Motorola bus? Do we flip the data bus or the address bus? In fact this is also a qustion for the cartridge and DMA solutions.

*What hardware address to choose for the memory mapping of the ethernet interface? Is one foreseen by Shiraz Shivji & Co? The Riebl card obiviously must have some address it dwells on?

*It looks to me as if this project can be realized in a very similar manner to the TOS 2.06 decoder for the ST series and even more the IDE interface. Any thoughts?

Anyone successflly connected the standard old BBC monitor to their ST?
I'd be greatful for advice...

I've got mine working with my ST but the colours are very washed-out --
the screen is almost all white in fact. I used a couple of small signal
diodes (1N414) for synching which works fine but the display is either
inverted (black and unreadable where it should be white) or else almost
completely white.

Inconvenient just the same;)
>

I've noticed that the DOA based FTP program in Win '95 also tends to convert
to uppercase. As with most command line FTP programs, though, you can specify
the source and destination names separately. I.e.:-

put myfile.tar

usually results in MYFILE.TAR on the machine I'm transferring to, whereas:-

put myfile.tar myfile.tar

results in myfile.tar being put there. In summary, therefore:-

put sourcefilename destinationfilename

is a useful trick for command line FTP programs (and can also be used to
get around the problem of moving long filenames via 8.3 machines.

>Isn't differential 12 Volts?

Hi Martin,

nope: differential is different... :-) all lines double and the layout on 50 or 68 pin connectors completely different. Usually used in mainframe systems. If you want to use it on a regular SCSI bus you need adapters at US$ 500 each...

You missed that part of the story, but quite some months ago I purchased an IBM 0661 SCSI-2 disk, didn't manage to get it to work and consequently sent it back to the vendor. I got a replacement drive, being an 0662 type, which turned out to be differential SCSI. No go on the bus. So I sent that one back too, phoned the guys about a dozen times and yesterday (hurray) the postman delivered a parcel containing a Seagate ST12400N 2 gig drive. Works flawlessly, is autobooting and thank God I have some diskspace again (at 3.7 gigs now I wonder for how long :-))

Meanwhile I picked up a Mega STe, swapped the keyboard with my TT one so at last I can type again normally, without using CTL-V to create an "l", the m-key, spacebar and Enter stuff work OK again. Next job is upgrading the mylar on the old keyboard... which now sits on the Mega STe.

The Mega came with a 40 meg Seagate, partitioned into 4 (!) parts, with AHDI somuch on it. I wiped out the whole contents, removed AHDI, repartitioned into 2 parts and now I boot from the external SCSI drive with Hushi. The Seagate boots by means of Hushi on the SCSI drive, and since it has ID 0 I use the C-partition to boot from... no probs at all.

Drats, I just missed a cheap TT with 6 megs, no HD, incl. VGA monitor... would have been a nice spare parts machine.

>All docs are in french, same remark.

You 'Hollanders' uses lots of French words in your language but doesn't understand French, strange isn't it? :-))

Anyway I don't think there will be an official English version in the near future. The makers of Wensuite don't even have a website. Strange but true.

>I tried to wrestle through some menu's (which show up pretty weird, around

>Matrix cards, but that was greyed out (demo feature?). When I tried to get
>other fonts it left with a #69 error...

No, I don't think it's a demo feature. I think however that any graphic card connected to the VME bus is supported if you use the ISA/PCI option in option/afficage/graphique. The Mach 64 plus card and the ET6000 are surely supported. Don't forget to save your setup (option/sauver inf)

>Need some decent translation of the docs (preferrably the RSC file too)
>before I can work with it. Perhaps it's a good replacement for CAB???

Hello French readers of this group, anyone volumteer to translate the docs/rsc?

As for this moment it can't replace Cab yet but they are getting somewhere. It's already much more reliable on my Hades then Draconis which crashes quite often.
It's a pity that Wensuite comes with his own TCP/IP stack.

CU
Martin

Martin, yes we do... but us "Ollanders" still are using Jerry-language
most and English second. I used to be pretty good in French but that's a
long-long time ago. Ever since I haven't visited France regularly I lost
most of it... Same with Portugese: I used to speak it understandably, but
the last time I was in Portugal/Brasil was 1971... Also I could manage
fairly reasonable in Swedish, but the last time was 1986 and ever since...
Daily practise is zero!

Well, it shows up pretty good on my card (24 bit rez) but like I said,
menu bar height = 1/2, so I read the Thing menu underneath. I can't
select the Matrix card item... That's why I figured it was a demo.

-SUPPORT MODE ON -

YES please, even crappy English would do!!! :-)

-SUPPORT MODE PARTLY OFF-
>
>As for this moment it can't replace Cab yet but they are getting
>somewhere. It's already much more reliable on my Hades then Draconis which
>crashes quite often.
>It's a pity that Wensuite comes with his own TCP/IP stack.

Don't complain. I bet we're the only platform with 5 different and
incompatible stacks: Stik/Sting, Mintnet, Draconis, Wensuite and Iconnect.
Each wanting it's own clients... Internetting on an Atari? YESSIR, make
your choice, select the components and off you go... Don't whine about
incompatibility! Phew, how the hell do they expect us to survive??????

Well, one final yell then:

HELLO Mr. OXO!?! Do you read Atari newsgroups? Is your market/future
market aimed at France only??? Then hit the "Next Message Button" please!
If not, is there any chance of getting at least an English RSC file with
Wensuite, preferrably accompanied by english docs as well.
Mind you, since CAB is no longer supported, you might have a terrific
chance of getting a lot of new customers worldwide!

(I wouldn't even mind changing my TCP/IP stack for that...)

-SUPPORT MODE FULL OFF-

You know, those French surely can program: look at Aniplayer, Vision,
whatever. Glad these got at least English support. I recall having seen ST-
Effets or something, great program. Too bad I didn't understand most of
the menu-items, so in the end I put it into the trashcan. Would be a
bloody shame if Wensuite went the same way.

Hi ,
For sale: a Lighthouse black tower for Atari MegaSTE (and TT if you
are a bit handy)
an empty Atari TT case, original, can also be used for
a Mega STE
Golden Image handscanner with Touch UP
Dyna Cadd with key
Masterscore Steinberg with key
Twenty Four Steinberg with key
Lots of textprocessors, databases all originals, all
with manuals

If you are interested, please react ! I live in the
Netherlands......

Joakhim's right...

... we shouldn't let this get to us. I figure this is PRECISELY what the Computer Dungeon wants us to do.

My club and at least two others offered to give all that a home, but in the end, it became a way for the Computer Dungeon to vent their anger at the lack of customers.

Dispite the fact that the offer was made over a large medium (the internet) and dispite the fact that people responded, it was their stuff after all.
So in the end, the Computer Dungeon got what they REALLY wanted..
.. a chance to vent and let off steam and a tax write off.

So long Computer Dungeon... I'm happy to say that when it came to the Atari community you were the exception and not the rule.

Doctor Clu

Interesting. When I upgraded with Veloce+ I used GDOS and NVDI 2.5 with
no problems. As soon as I used NVDI 4 the fonts went whatever I did with
the assign.sys file etc. MagiC was definitely out as according to GST TW2
is very fussy about file selectors.

Does DYNACADD work with HOP7475A plotter? If it does then I'm interested...Is there anything you want that I do (Mario agent for UK)?....I saw DYNACADD for sale at the last few Atari Shows for about 30 UKP, which is about a tenth of the price it used to be, but then I guess it isn't supported anymore....

On Sat 03-07-1999 20:50 (GMT) Louis wrote:

>The controller board in the casing for the Seagate, is it a SCSI adapter?

Yes, it is simplified SCSI adapter - for 1 drive only. Jumpers on this
drive *must* be set to SCSI ID=0. With the another setting adapter
can't see this drive.
You have to remember to disable parity control on this HDD. Internal
SCSI adapter doesn't support parity control.

>Furthermore, there are 3 dipswitches on
>the board. These for ID settings or what?

Yes. Dip switches 2 and 3 on your host adapter are to change the SCSI ID
number and goes as follows:

2 3 ID
=============
ON ON 0
ON OFF 1
OFF ON 2
OFF OFF 3

Dip switch 1 is set to ON at me but I don't know what is its purpose.

>I figure so, since all three are "on", thus giving ID 7 for the board...

It is strange! I also have all three switches ON but my 730 MB Quantum
Lightning appeares as SCSI ID=0!

>Problem remains that
>one cannot put Hushi on this disk, since SCSITools won't recognize the
>drive as a SCSI one. I don't like AHDI, it crashes some oldies that Hushi

Both: Hushi and ICD drivers work at my internal HDD properly.
Using ICD I can boot from internal or external HDD, I am can't recall
how about Hushi.

>How about mem expansion? There's 2 free slots (upper and lower ones), I
>figure 30 pin SIMMS would do, but does one need to fiddle with the nearby
>jumpers?

No. The only thing you should know is that SIMMs have to be inserted in
pairs: 2 even slots or 2 odds slots or all 4 slots.

>How about the floppy drive? This one won't read HD disks... but it might
>be just a dipswitch setting. Once again, which one was it? Bloody "manual"
>(wrong word for such a thing) doesn't mention it at all.

Most of MEGA STE's were equipped with floppy drive 720 kB.
When installing drive 1.44 MB one needs to change a dipswitch on
motherboard. Which one? I don't know :(
I have a 1.44 MB drive installed on my MEGA STE.
On its dipswitch bank S701 all switches are OFF except a switch number 7.

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

In my opinion the G3 Macs are yet another example of Apple being so
obtuse as to be funny.

Example - go to the apple web page and price a G3. With:

450MHz
64MB RAM
12GB HD
16MB PCI bus video
24X CD-ROM (?? this is last years technology!)
10/100 Ethernet

Their price is $2519USD

Now go to the Dell web page. For $2500USD you can get:

550MHz CPU
256MB SDRAM
25.5GB HD
32MB AGP video (*much* faster than PCI)
6x DVD-ROM/32x CD-ROM
Sony CD-RW drive
Altec Lansing speakers w/subwoofer

3COM V.90 modem
100MB ZIP drive
1.44MB floppy
3COM 10/100 Ethernet card

Needless to say even an interpreted BASIC software emulator on a 550MHz P-III would emulate an Atari rather quickly - and it would have all of the standard connections, cheap peripherals, drivers and connectivity features the Ataris and clones will always lack.

Economically speaking, new Atari hardware doesn't make a lot of sense. In six months to one year the same Dell system will probably be in the $1500-$1800USD range.

Just my thoughts - though I have an interest in 68K based computers in general and Ataris in particular (if I found a good deal on a Falcon or TT030 I'd snap one or two up quick like) but I think the PC won a long time ago...

I realise that. It just seems that many other CPU's -DO NOT-
require the extensive cooling that Intel ones need, just to
operate at room temperature. Just look at the CPU in my old
Falcon...the 16MHz 68030 is being run at 32MHz currently and still
I can put my finger on it! You can't even put your finger NEAR any
recent 80x86 design without receiving a 3rd degree burn! Sending
the clock rate even higher might result in fire!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Which version of Wensuite?
Have you tried it under plainTOS?
Here on my Hades running N_AES 1.2.0/freeMiNT 1.15.2b I don't have that
problem.

Version 3.12b is the one I got and I can't get it to work. I tried
under single tos and still the same - maybe I'm doing something
really stupid but I can't think what.....I thought it might have been
overscan as I've had probs before with that but even when disabled I
can't get it to work. I was really looking forward to trying it as
well.

That's debatable, and it depends on what kind of games you like.

> a PC can handle the best games around 6 months (assuming that you change your video card every 3 months)
> with one PC you can't play with a lot of friends...
> with a single Playstation and a good TV you can use four-players games and burn your brain ;-)

Maybe so, but several games on the Amiga (and probably Atari as well) allow at least two players.

I agree with some points you raise. I would rather not spend as much as I've spent on upgrading PCs for games. Inevitably, you always go one upgrade too far and create an unstable system that's no longer enjoyable for anything. Sometimes that can happen on the very first upgrade! ;>

But there are big advantages to computer games over console games. You can't save games on a console. You can't download new levels on a console. You can't create new levels on a console (I've done about 15 levels for Doom and will soon start on Quake/Quake2). On existing consoles maybe you can play four-player games, but with computers you can go online and play against dozens of opponents.

I think maybe the new breed of consoles will be more interesting to me, so long as they include hard drives and online access. Still, a console would require some computing ability to host a level editor, unless someone wrote level editors to run on PCs, Macs, etc., whose output could then be loaded into a console game. I keep hitting this point because unless a game offers level editors I usually have no interest in it. But that's just me. :>

The new Amigas will appear, and they will run an OS based on the QNX
Neutrino kernel. CPU of the new Amigas will be announced in London
at the World of Amiga show and in Sacramento at AmiWest 99 in the last week
of July.

> Maybe QNX kernel is the way to go, it may replace Mint, as both are Unixoid).
> So, maybe some kind of TOS-for-Intel-CPU might be designed instead of new
> Atari-clone hardware.

QNX has more than one kernel. QNX-RTOS is their main industrial kernel
while QNX Neutrino is a somewhat lighter version. But there is really no
currently widespread commercial version of QNX, and because it's a
relatively small company designing a mission-critical kernel for factories,
NASA, etc., licenses are very expensive. Expect that to change,
however. ;-}

BTW, thanks for all the info you gave on the Atari emulators. I'm planning
on buying Gemulator. :>

>jumpers?

No, just slap some memory in and let the computer worry about finding
it:)

>
>Problem, as usual: I got a nice dutch Owners Manual, which explains there
>are 2 types of Mega's, 2 and 4 Mb types.

My Mega STE was, wait for it, a 1 meg machine!!! I broke the seals and
fitted 4 meg with no problems at all!

>The 2 seals across the bottom screws "break this and you'll loose all
>guarantee" didn't worry me much, but appearently Atari considered users as
>dumbo's who can't manage to shove in two extra SIMMS and move around some
>jumpers... So there's nothing in the manual about it.

On the normal STE's the operating system (TOS) sizes the memory up when
you switch one. Unfortunately TOS 2.05 gives you a blank screen while it
performs the test upon a cold boot. With TOS 2.06 you can see what's
happening:)

Pressing any key by passes the memory test.

>
>How about the floppy drive? This one won't read HD disks... but it might

The model I have had a high density drive in as standard. Under TOS 2.05
it was touch and go to format a 1.44 floppy let alone read it. Since
upgrading it to TOS 2.06, these problems have disappeared.

Well, WE don&#65533;t use zip-cartridges, you do. :) Many atarians certainly have no zip-cartridge included on their system. To allow easy transfer of smaller files between ST-PC the old 3'5 disc is still quite handy.

Maybe it is so, that we sometimes must jump to a new standard, but it is also very obvious that it can and will have disadvantages to do so. I just can&#65533;t agree to call it innovative to take something OUT of the system. That don&#65533;t make any sense to me.

However, I agree that this old format is on its way out, even if it is still used, and useful. IMO it wasn&#65533;t very clever to not include them on the new neon-Macs at this point.

> > I also guess that the G3:s power in itself isn&#65533;t really innovative, and

> only Atari and Amiga have done it)

I am not enough familiar with the prices of Mac & PC systems to argue with that. It could be so. Then the G3 must be very cheap, since there are quite a few PC-setups available for very small amounts.

> And, absolutely MacOS is a very heavy, old system... but Linux works very well and Mac OS X will
> come soon...
> Would you want to use Win2000 ? You need 128mo RAM...

I never said that. :) I just said that the Mac-OS is a bit to heavy and slow, which makes the system a bit slower than the G3 might have wanted.

I guess I'm prejudiced by my own experience, since mine crapped about two
months after I bought it. The press has been pretty tough on them since,
also. The famous 'Click of Death' stories.
>
> SD>Much better to use the LS-120 super floppy.
>
> AFAIK, these are much slower than the Zip drives are, and there is no SCSI

They are slower, but I prefer larger drives for HD-style performance -- a
personal preference, which no one else needs to agree with. :> I thought
there was a SCSI version, though I may be confusing it with another drive I
saw listed as an option for a BoXeR system.

> I don't know of external versions either.

I'm pretty sure there's an external USB option with special casing for the
iMac.

>They are not bootable unless
> there is special BIOS support,

Ooh, bummer.

> and it might be impossible to read exotic floppy
> formats (like "hyperformat" Atari disks) on them.

This is definitely a potential danger. Might be worth trying out if you
know someone with a Mac/PC and a good Atari emulator.

> SD>For bigger back-ups, use a CD-Rewriter rather than some removable hard
> SD>drive like a Jaz.
>
> That's perfectly true. Especially with media prices for CD-RW being very low
> and thus enabling multi-generational backups.

FWIW, the new Orb drives look pretty interesting if you felt like going to
a faster, more dedicated HD-style backup. The prices are definitely low
for the space.

>Whats the deal with that?
>
This is normal.

The SM124 was shipped like that to present an absolutely accurate representation of the graphics created by the ST.

What that means is that if you draw a circle in a program, the circle on the monitor screen will be absolutely round, not oval or distorted.

This was done because the monochrome systems were originally aimed at desktop publishing applications where it's important that the screen represent exactly how the page will print on a printer.

For most applications and games, this is not important at all, and it quickly becomes annoying, having those wide black borders all the time.

The good news is, you CAN adjust the monitor to give you a full-screen image. The bad news is, you can get KILLED if you touch the wrong thing inside the monitor, even when the power is turned off.

There used to be a text file floating around that gave pretty exact instructions on how to do this, but I haven't seen it in many years.

If anyone knows the name of the file, or where to get it, jump in..!

There are NO modifications needed to the monitor's hardware, just adjustments to the internal controls.

You'll need a plastic screwdriver (preferably NOT a metal one, to keep you insulated from nasty voltages) and a plastic "coil adjustment tool" with a hexagonal shaft. Radio Shack in the US sells these pretty cheap, check at electronics suppliers near you.

There are two adjustments, one for height and one for width.

Both of these adjustments have to be done with the monitor turned on, and connected to the ST, so you can see the results of changing the settings. Be VERY careful not to touch anything but the controls involved, as there are LETHAL electrical voltages inside the monitor.

Like I said, you can get KILLED if you touch the wrong thing.

The height adjustment is done on a "miniature potentiometer" on the main circuit board of the monitor. There are a number of these on the board, and I don't remember which one is for the height. Some control the brightness, others control the contrast, and there's another one for the focus of the picture on the screen.

The potentiometers look like small black (usually black, but sometimes they may be blue or white) wheels, about 1/2 inch (1 cm) across. There is a slot in the middle of the wheel to allow it to be turned with a screwdriver.

Put the plastic screwdriver blade into the slot on the first wheel, then carefully watch the screen and turn the wheel slightly. Observe the results of the change. If it does not change the height of the picture, turn it back to where it was, and try the next one.

(If you're really, really lucky, the potentiometers (the wheels) may be labeled on the circuit board. It varied from monitor to monitor whether or not the function of the potentiometer was silkscreened on the circuit board. If they're labeled, look for one that says "height" or "v height".)

When you find the one that changes the height, adjust it so the picture almost fills the screen, top to bottom.

The horizontal adjustment is done with the special coil adjustment tool with the hexagonal shaft.

The horizontal control is a small coil of wire about 1/2 - 3/4 inches in diameter mounted on a white or translucent plastic tube which is about 1/4 inch in diameter. The coil is horizontal to the circuit board, and is usually tan or copper colored. There is only one coil like this in the monitor.

The adjustment is made by inserting the shaft of the tool into the plastic tube and turning the small iron core that is inside the tube. This will cause the core to move up or down inside the coil, which is what causes the width of the picture to change.

The tool may have differently sized shafts at either end. Try both ends to find the one that fits the hexagonal hole in the iron core.

Carefully turn the core in the direction that causes the picture to widen until it's almost to the edges of the screen.

One other thing you might want to do while inside the monitor is to touch up the focus adjustment, if you can find it.

Usually it's not possible to make the picture sharply focused over the entire screen, so if you make the center of the screen absolutely sharp, the corners may be fuzzy, and vice-versa. The best compromise is to make the picture about half-way to the edges as sharp as possible, so the center and corners will be acceptable.

It helps to display a screen full of text when making the focus adjustment.

If you're still alive at this point, put the cover back on the monitor and enjoy the bigger screen.

There used to be people who claimed that enlarging the picture in this way would shorten the useful life of the monitor, but there is absolutely no truth to that. All you're doing is adjusting the margins of the picture back to where they would normally be, before Atari changed them.

You'll notice that you can no longer display a perfect circle on the screen, but this shouldn't affect most applications and games.

Remember, the voltages inside a live monitor can KILL YOU.

If you're not comfortable doing these adjustments yourself, take the monitor (and the ST) to someone who works on TVs or computer monitors, It should only take about 15 minutes of their time to do this adjustment for you.

Good question! And why tell everyone through this newsgroup that they have wasted a lot of stuff that people would have loved to get their hands on?

It sounds to me like they are just trying to make people pissed off. I really can&#65533;t see any other reason to shout it out load here that they have destroyed all that stuff. Really!

I think the best thing here is to ignore their posting, and not spend any time thinking about it and get upset. If they have crushed a ton of stuff when people have been begging for it, then there is really not much anyone can do about it. It is basically their problem. Don&#65533;t let them piss you off!

I'll have a look at the dipswitches, must be in the DD position...

It's "maintenance-day" again, first this Mega to look at, next the TT to
get the Serial-2 hooked up. Oh well, they did forecast rain and
thunderstorms anyway...

Maybe some of your question can get an answer in the small FAQ. If you
have an old key you may need a new one. Also take care if you move the
program after it's first start: if some paths are wrong and it cannot
find its config files, the program may crash. I just use it offline
(not registered yet, maybe soon as it seems to support CHAP by now)
and have no problem here, even in fast ram.

Bye,
/Pascal/

That is exactly what happens when I try to run it Charles. I thought
that maybe you had to have a registration number but from what I can
gather through reading the documentation with my rather limited
French, this is not the case. I'm stumped with this one.

>regardless wether they are case sensitive or not.

Hi Oliver,

I think you are wrong on this. The case sensitivity *in practice* may be platform dependent at the server end of things, but as some systems are case sensitive the standards for URLs specify that they are case sensitive. Can't quote you the RFCs off the top of my head, but I *think* I read this in the HTML 3.2 specs as written by Mr Berners-Lee himself.

WRT your second point, even if domains are not case sensitive (hence it doesn't matter with email addresses), the subdirectories on the server may be. Hence you need to enter the URL accurately as you don't know (or care, usually) what OS the server is running. Again, this is why URLs are defined as case sensitive.

WRT to design and typography, using odd cases etc when displaying URLs to attract attention is simply an example of the rather cavalier attitude of *some* designers towards "that technical stuff": good design does not obscure accurate information for the sake of effect.

Reaklly....How did you get 230k4?...I've managed 115k2 quite happily, but a 56k modem should really be running a DTE of 230k4 if possible....I've seen DTE limited download speeds sometimes....

>:>The Falcon's modem2 port can go up to 115Kbps.
>
>That 'K' is a mistake isnt it?.
>

Nope, 115k2 is 115200 baud....It should go to 230k4, but some of us haven't been able to get up there yet...actually some modems won't run that fast either as a lot of P{C's don't bother with anything over 115k2 on their serial ports so the modem manufacturers won't sepend the extra 5 cents to put a better serial port handler in their modems...

There are two version... one with a VME connection and one with a
MegaBus connection. Don't know what bus is in the Mega STE. I don't
think it's a VME bus.

> >I use it with MiNT-Net and it works rather well.

Drivers for STiNG 1.20 are available, and are supposed to work.

> US$ 500 each...

I believe the differential adaptor drives the lines with 12V. Connecting an
ordinary SCSI disk to such a port would mean certain death for it.

Going the other way around, connecting a differential SCSI drive to an
ordinary SCSI port maybe works fine?

The point with differential is longer cables. The max lenght is 25 meters
opposed to 3 for standard SCSI.

There is a new SCSI standard with much longer cable lenghts and faster
communication. It's in fact a network too.

Djordje Vukovic <vdjole@EUnet.yu> skrev i
diskussionsgruppsmeddelandet:7llmup$2jr$3@SOLAIR2.EUnet.yu...

> I agree with Pera (though I think that his speed estimates are a bit
> optimistic): the future of Atari may vey well be in emulation.

Why bother?
There are many OS:es out there, most do the same things that Atari does.
In some cases the software is ported from one platform to another,
Ghostview Unix --> Ghostview Atari, or the other way around, Cubase on the
Atari to Cubase on the PC.

Besides, GEM the Graphical Environment Manager, is out on the net in source
code for anyone to grab and play with. You can find it at
http://www.freshmeat.com. There are some rumors about a port of GEM to
Linux, actually by a bunch of crafty Swedes...

The only part of the OS a normal user needs to bother about or gets in touch
with is the screen and graphics management. Keyboards and mice work the same
way on all machines.

Besides, the TOS is hardly a jewel among OS:es! The first version can't even
handle the serial port, at all! Try and use a serial printer on such a TOS
1.0 unit. No go. The hard disk management up to TOS 1.2 is a joke.

Looking at other OS:es one envies features like the clipboard in Windows and
the centralized printer manager in all OS:es exept for Atari...

Not much to emulate...

> There is simply no way that any Atari-clone manufacturer can produce
machines
> competitive with cheap PC-hardware that is produced in millions, and
> available even in supermarkets.

Most of the harware in a PC is sharable and not specific for the PC.
The PCI and ISA buses are more or less generic and can be included in most
designs. So are the memory modules, graphic cards, CD players etc.

What it all boils down to is a hefty CPU unit (like the Pentium cassette or
Sun Sparc CPU) with lots of megahertz and lots of cache. The motherboard is
then merely a bridge to the ISA, PCI, AGP and other buses, where the
additional hardware dwells.

Follower companies, like the Atari clonemakers, can't afford to make up
their own buses, which would seriously narrow the choices for their
customers. Companies like Sun can do that, since their main concern isn't
compatibility with the PC or low price.

So in the end you have to ask yourself the questions: What is the gain in an emulator? What's the gain in an Atari clone? Can it do something better than a Mac or PC? Or is it considerably cheaper?

An emulator is no gain. Just messier and more cramped than the original system. Nostalgia and very special odd programs are the only justifications I can see for emulators.

Atari clones? These could have some more justification in some cases. Specialized niche applications could find it's customer base. Atari was once big on the MIDI scene. There were also some brief successes with the harddisk recording possibilities for semiprofessionals.

This route may still be a good way to promote the Milan and Phenix computers.

Another plus would be to promote them as servers. Viruses for the Intels wouldn't bite on them. For server purposes there has to be complete and stable Linux ports for them. Which shouldn't be that hard to accomplish, since there already is a Linux for m69k machines.

When looking at the specifications for the Phenix it reads that they've disposed of the printer port and the serial (RS232) ports. Centek suggests bying USB to parallel adaptors and the same for the serial port. Thanks a fucking lot, Centek.

Does it not remind of the cheapo "ACSI" port on the ST:s? You had absolutely no use for it unless you bought expensive SCSI adaptors. The extra cost for Centek to include these ports is maybe 50FF, the customer will lash out maybe 700FF for these adaptors... It's the same type of "progress" that Apple makes when it excludes the 3.5" floppy drive, which would cost them maybe $10 per unit to include. How much is the aftermarket floppydrive? $100?

> Maybe QNX kernel is the way to go, it may replace Mint, as both are Unixoid).
> So, maybe some kind of TOS-for-Intel-CPU might be designed instead of new
> Atari-clone hardware.

QNX was included in the current issue of the german CHIP magazine's CD, along with SuSE Linux 6.1. My friend bought it yesterday just for the CD, he's a Linux aficionado...

> And then, someone may design a nice Fuji-logo sticker to put on the

The latest demo (ws312b) runs quite happy on my Hades, even with copy
back on. I haven't tested under singleTOS but with N_AES 1.2.0/freeMiNT
1.15.2b there isn't any major problem (for the moment)

You can find the latest demo on the Belgian ftp-site:

ftp://193.190.204.128/atari/www/wensuit/ws312b.lzh

In case you've troubles to reach that site -it seems there are some,
mostly French, who can't reach the server- you can get from

http://home.worldnet.fr/aspromet/

Follow the download links.

1522. Modem speed

Newsgroup: comp.sys.atari.st
Date: 1999-07-04 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <377f57225b0760@holleman.demon.nl>
Source record: 76387

Hi, once more!

Right, I stealed the Serial-2 connector from my Mega-STe and fitted it to the TT. Next changed some files for Sting, and first set the Serial Ports CPX to Ser.2/LAN, speed to 19200 (which is the highest it shows). Next Sting reported on establishing the connection a speed of 48000 bps (which is the *actual* speed) as usual running on Modem-2, and I fetched one article from a group with Newsie, where the log states the article came in at around 1600 cps (corresponding to a 19k2 line, or a 14k4 modem).

Next I set the CPX to 110, logged in again at 48000 and the article came in at 3500 cps, which I recorded running on Modem-2 also.

My modem is a V90/56k one, I reckon it can do better than that.

How do I set the bunch for 115K and get higher transfer rates than the 3500 cps I already got from Modem-2? (apart from what I've done).

Martin,

just grabbed this file from the server, no probs.

After decompression:

For the first time ever, I saw something like a decent browser...

I admit, the last one I tried was 2.something or so...

Haven't set it up yet, just tried the browser. Next problem is the
language. My french is pretty rusty... :-)
All docs are in french, same remark.
I tried to wrestle through some menu's (which show up pretty weird, around
2/3 of the regular size. Same as the icons). Saw an option for support on
Matrix cards, but that was greyed out (demo feature?). When I tried to get
other fonts it left with a #69 error...

At least what I saw looked a lot better than the orange background with
some bluish characters (unreadable) in previous versions.

Need some decent translation of the docs (preferrably the RSC file too)
before I can work with it. Perhaps it's a good replacement for CAB???

>Atari emulators. All three work at approximately the same speed (with

STEmulator in GDI mode is about a trillion times faster at VDI graphics,
which is rather important for GEM applications. It's commercial or
shareware IIRC, though (I've only tried a demo).

>* Some programs do not work:

Well, some programs don't run on all native Atari machines either.

>* Screen refresh and mouse movements are slow and jerky:

Converting byte/pixel graphics to the Atari bitplane modes can be done
as fast a straight copy to the screen on an AB040. Doing things the other
way around shouldn't be very different and the current x86 processors are
very much faster than a 32MHz '040.
Combine that with update checks and I don't see any reason for updates
to be the least bit slow, unless you're trying to deal with horizontal
blank interrupts and colour changes on the fly in a bitmap mode.

> It seems that the brute force of fast PCs is overcaming this drawback
> at last. Maybe writing NVDI screen drivers specific to use with
> an emulator might also help, as they may bypass some of the emulation
> and go directly to the hardware.

As can be seen in STEmulator (and in STonX when using the X/VDI driver),
native screen support is _very_ nice indeed.

The way to do this would be to write drivers for fVDI rather than NVDI.
Not only does it seem to be impossible to get information about writing
drivers for the latter, NVDI also costs a whole lot of money.

I've actually approached two or three of the emulator writers about
this. One didn't sound the least bit interested, but the another
might be (he wanted a fool-proof installation archive of fVDI to try
it out, though, and I haven't got around to that yet).

Writing such device drivers under Windows would be really simple
(all the necessary functionality is there for the grabbing in the GDI).
It only requires a reasonable way to call 3rd party native x86 code

from inside the emulator, which shouldn't be very difficult to add.

>* Floating-point performance is very miserable:
> Adding emulation of a floating-point-coprocessor (routing those calls
> straight to the real one in the CPU) should not be too difficult,

Perhaps not, but it would require reasonably complete '030 emulation
since a program that uses the FPU directly is also likely to use other
new instructions.
I seem to recall that GEMulator supports the newer processors and an
unreleased version of STonX was supposed to boot TOS 3.06. I don't
know about the others.

>For the moment, the Gemulator seems to me the best candidate for a good
>emulator. I would prefer, though, an emulator that does not drag the burden
>of a monstrously large operating system (Windows, that is), even if the
>emulator is so well designed that this has no speed penalty.

Actually, running a properly written emulator under Windows rather than
DOS would give a large performance _boost_ rather than drag.

>I would like an emulator that operates on DOS stripped off of all things
>unneeded, maybe keeping just that couple of system files, and some device

No, you wouldn't.
You wouldn't have access to much (if any) graphics acceleration on such
a setup, for example.

>Or, maybe, one can dispose of DOS completely, and use just a little of
>PC BIOS to boot up, and after that dispose even of the BIOS. The compact QNX

That would be absolutely silly. And you probably wouldn't be able to
access most of the hardware on the PC either. One of the main ideas
about operating systems is to abstract the hardware from the applications.
Windows does that to a much higher degree than DOS.

>A new version of some TOS-derivative would be needed anyway, to take care
>of all those interfaces, PCI, etc. So the new de-facto standards and

On an emulator under Windows you wouldn't have to worry about much
of that.

This is actually what NVDI-PC4 or NVDI5 does with MagiC-PC. MPC without NVDI is quite jerky etc. NVDI makes the whole thing very much better. An English version of MPC6 would make things better still (*taps fingers*)...

I meant the entire Mega ST assembly, not just the CPU itself. I was (awkwardly) trying to say I don't need a monitor. But I seem to have tracked my problem down to the Unitor card, and not the Mega itself. The computer works fine once I remove the Unitor.

Hey, I'm really loving this term program. I would send off to get this wonderful program registered.....

... but I know better. Anyone have a key they would willing to share/give away/sell?

This is not my normal practice in the Atari world since I realize that we must treat our developers right... but in this case I'll make an exception. :)

Doctor Clu

PS: For those new to the Atari scene, I'll be happy to inform on Freeze Dried Term and why I ask in this way.

> saves you a 500 dollar adapter :-)

Well, it rather think he uses an LVD drive (Low Voltage Differential),
which is also capable of running on a standard (i.e. non-differential)
SCSI bus without the need for a special adapter. Of course, in that
case, the cable length is limited to the usual standard SCSI specs.

Ciao

Thomas

1537. Re: Are ATARI computers Back ???? !!!!

Newsgroup: comp.sys.atari.st
Date: 1999-07-05 00:00:00 UTC
From: Steven Kaleita <sak01@chorus.net>
Message-ID: <37817128.70F4A437@chorus.net>
Source record: 76252

I for one, have been a loyal Atari user since 1985 and currently still use a TT, Mega4, 1040, & 2.5meg 520. In January of 1999 I purchase a Beige 300mhz mini tower G3, with 128 megs ram 9 GIG HD, ZIP drive, floppy, CD rom, SCSI port 2 serials ports, built in ether net port 3 PCI ports, audio in/out, video in/out.

Nice machine...However...

After experiencing all the extra junk they put in the OS to appeal to the general public, and removing most of it, I also noticed this to hold true for the software. There seems it be a lot of useless junk for the people that use computers professionally.

And this all means the same thing, you need a damn fast machine to efficiently use all this overblown stuff.

Need less to say... I wasn't impressed with the speed increase from my 32 mhz TT, to this 300mhz G3, while running programs like Adobe Illustrator, Corel Draw, Photo Paint... WHY?

Because the more powerful the system, the the more bells and whistles the software companies seem to add.

I have been using Calamus ever since it was first created, and the graphics that I was doing with my Atari was progressing to the point that I needed more RAM and more speed for screen redraws. Printing was never really an issue because of the DMA port and the SLM804, was pretty fast at printing all my color separations. But those screen redraws were nigntmares...accidently move something a fraction of an inch, and the screen had to redraw all over again, somes times taking minutes each time.

When I finally bought this MAC G3, I found printing to be a real bottle neck in regards to speed, and the processing of the images into color separations, was alot slower then Calamus on my TT. Screen redraws were much improved, and a relief, but the over all system was no where near as stable as my old TT, and I'm still trying to reduce the number of system crashes and freezes I experience... things are getting better however, it seems that many of the software companies are upgrading their software to be compatible with Mac OS 8.6 and the new G3's, but I'll bet that none of then are actually doing the work on G3's, so the software is still buggy on a G3.

When I installed MagiCMAC on this system and loaded Calamus SL, I WAS IMPRESSED!!!!!!!!!!!!!!!!!!!!

Calamus SCREAMS on this G3... it's faster then any mac program I own, running on the mac, and when you compare that to the speed of Calamus on

a TT, it would impress you also. The boot-up time for calamus when loading all it's modules is less then 10 seconds. And when I do a 4 color separation star screening, of a full page image scanned in as 300 dpi 32 bit, the image is processed within seconds, and that took minutes on the TT.

So I agree about the efficient programming we Atari users have taken for granted. I find it hard to believe that a so called emulator (MagiCmac), runs Atari software faster then any Atari could, and Atari software runs faster then Mac OS software runs on a Mac G3.

Until I get the new Calamus 99 mac print driver for MagiCmac, I do all my art layout on the G3 and save it to disk for output on my TT.

It seems like the postscript standard in the graphics world is a real overblown speed eater. I have an old Postscript level 1 laser printer, and in it's day (1992), it was top of the line, state of the art, and cost 3 times as much as my TT did in 1992. this is a 1200 dpi, 11x17, 21 megs or ram 80 internal scsi HD, 135 fonts, ether net, appletalk, serial, & parallel ports. What takes hours to print on this printer and this new G3, takes less then 3 minutes on my TT/slm804... same file reassembled in Calamus Sl.(10 meg file), The mac users tell me that I should get a new postscript level 3 laser printer to speed things up. Imagine that!

What is wrong with this picture?

Now don't get me wrong... I love all the new and advanced things I can do in all this system and software. Things that will probably never be seen on a Atari/clone, but some of the stuff that I'm doing with my artwork and Calamus, will probably never be seen on a MAC or a PC, with out an Atari emulator. And it's all because of the same reason why Atari never made it big...

Because it could seriously effect the bottom line of some of the biggest software companies holdings in the market. (keep em out of business, or buy em up; so they can't compete). Money talks, and it really doesn't matter that your product is better then someone else's. What matters is, do you have enough money to really lay on the bullshit about your product.

When I see and experience my old DEAD Atari, out performing a brand new state of the art system & software, it really makes me wonder how much bull is really going on.

Good old american marketing. The ad agencies are paid to get the consumers to believe they need this stuff...and we do; don't we?

Now I hope I didn't open up a can of worms, I just wanted to share my experience with all you dedicated Atari fans.

SAK :)

Hello John,

j> > Maybe you have "lousy" components?
j> > Maybe you use a slow emulator.
j> I don't think so. ATI Rage AGP video, Seagate Ultra DMA HD. I've heard
I believe you, but ...

j> this hardware is fast with a lean OS like Linux, so I'm reading up on
... just a fast graphics card and a fast hard disk does *not* make a fast

system.

It's difficult to analyse a system from distance, but there a soooo many
traps to make a PC slow (correct configured BIOS, correct configured
adapters, correct configured RAM caching and many more?). And still with
having slower components (slower graphics card, slower hard disk, slower
CPU)
...

j> that now. But Windoze really puts me to sleep with long boot up times
j> and lengthy hard drive accesses. It's always a pleasure to boot up the
j> Falcon or STE and get a quick boot up, and software that quickly loads
j> into memory and stays there.
... my PC seems to be *much* faster booting and running Windows and ST
emulation within (*even* if I use the old MagiC PC 6.0 and not the new
faster
6.1 - only the DOS based emulators have a lack of speed in comparison to
all
Windows based emulators).

Hi

Just a short note to mention that you can now register for Atari shareware via CyberSTrider using your Credit Card (Mastercard/Visa) or Debit Card (Switch/Delta) via my web site.

http://www.cyberstrider.org/

follow the link that informs you of the online payment system. No need for Americans/Canadians to send me Dollar cheques/International Money Orders.. and no need for Europeans (non UK ones I mean ;) to send me Eurocheques.. just pay via the site...

You may also be interested to know about things my other company (Cyberstrider Limited) is doing... (domain names, web hosting, ecommerce)

I would be forever grateful if you could help me with a problem I have, here it is ....
I have an atari STe connected to a -Steinberg DMA to SCSI converter - than a SCSI ZIP drive. My Problem is I can't get the Atari to recognize the units. I'm using AHDI software...this could be the problem I think, although other sources from the net say that it should be OK. I can't find any info about the Steinberg converter at all..was there special software for it maybe. The unit also has 4 dip switches which I think is the ID number, so I've set this to ID 5 the same as the ZIP. From what I know, this setting I think is ....off on off on. I don't know what to do next and resources are getting harder to find. Any assistance would be greatly appreciated.

Russell Lucas

Hi Dennis,

I seem to recall that Newsie works OK with "figure-adresses", but I'm not sure. Try feedin' it chapelie.rma.ac.be , I think that one can be used too now. If it won't work, time to look for another FTP program. You're still running plain ole TOS, don't you? In that case I think aFTP is useless...

Krzysztof,

Tks for the input. Well, I figured the board/controller could need ID-7,
therefore I figured all 3 dips were on which should be ID-7... The drive
itself has ID-0, there's no jumpers set and the SCSI-ident shows 0.

Actually, SCSItools sees the drive OK, in the ident it's shown. However if I want to install the driver it doesn't show up in the selection. So what I did was remove AHDI from the Seagate, the Conner had a Hushi.sys on the first partition already, thus at boottime the system finds that driver, and since Hushi standard boots from drive C, which in this case is the first partition on the Seagate I can use the Seagate to boot from... But only if the Conner is hooked up too or I need a floppy with a driver.

Yup, found that out already: I took out one SIMM and shoved it back in but into the wrong slot. So they were sitting in slots 2 and 3. No more video output... After some time I tried moving one SIMM into slot 1 and the stuff was back to normal... :-)

How about 4 x 4 Mb SIMMS? Would it take that? I know the 68000 is limited to max 16 megs, but will the TOS recognize 16 megs? That way I could put MagiC on it plus a bunch of NVDI stuff and make it more like an extra workhorse. With 4 megs it's no fun M/T-ing... And I don't like to work non-M/T-ing.

As someone explained yesterday: dip 7 is for DMA sound (ON = DMA enabled) and 8 is for an HD drive (OFF = enabled). Still wonder what nrs 1-6 are for. I figure I have a DD model anyway.

Which version ? The latest is 3.12b.

Have you got a serial number? without one, you won't be able to connect,
although the web browser will work offline.

Yes you do. The downloadable versions are updates. You need a serial
number, otherwise you can't connect to the net.

For sale at reasonable cost:

Back issues of ST Format, ST User, ST Review and Atari World
complete with original cover disks. To be sold as one job lot
with no splitting. Three free binders included in deal(two Format,
one User). A veritable tonne of useful info and programs.

Based in southwest London/Surrey borders and need the space!
Buyer collects. Come on - make me an offer!

Cheers :)

I'd be happy to volunteer, but I think they already have a translator working for them.

Anyway, there main problem nowadays is that they don't seem to be too keen on handling overseas orders, so since you can't connect without a registration number, there's not much point in translating.

As much as I disliked the early versions of Wensuite, it is really getting better a better. The latest versions are getting very mature indeed. It's just a shame that they can't seem to be bothered with putting up a website of their own.

Anyway, anyone who would want to contact them, Wensuite costs 290 FF (translate to your local currency at http://www.xe.net/ucc/), and they can be contacted by email at oxosystems@softel.fr (I'm not sure if they can handle requests in english though).

Nowadays, Atari is even more marginal than it was before, so you
CANNOT expect "power without the price" anymore, if you wanna
use your machine for any serious work.

> I am looking for a solution to connect my MEGA STE with my son's PC but
> I want to make it in a reasonable price.

Direct serial link, then. Using TCP/IP with STinG or MiNT-Net.

> What is proper name of this card: Riebl or Riebel?

Riebl is what is printed on the card.

Yes remember: if one of the wires of the 19 is a ground-cable it
reall is a voltage-return wire.
So connecting the shielding on both sides with ground makes two wires
connecting each other. That is wrong.

Most of the real Atari cables are made wrong.

How can a 520STFM change video modes when connected to an SM125. You
should only have Hi res available. If you actually have the other
options, then something's wrong !

No, in SCSI, all devices should have a different ID. Your host adapter
should be set to ID=7, definitely not the same as your Zip.

I didn't know Steinberg made SCSI adapter.

Anyway, you should try to get hold of AHDI 6.061, which is probably more
advanced than Steinberg's stuff, or better yet, HD Driver, which is
commercial, but supports all the features of Zip drives.

It's hardly a "division", let's say a small company paying big bucks to Hasbro just to use the name, all of which has yet to be confirmed. As for Hasbro's game division, well I wonder what Nolan Bushnell has to say about it...

<snip>

>

> low opinion of the early days of the Atari ST).

I really doubt the above assumption. Here in France alone, there were thousands of them being sold every month. The 520STF was probably the most popular games computer at the time. In Germany, it was the higher end models that were popular. The Amiga sold slightly less here because of it's slightly higher price.

It was my understanding that C-Lab stopped selling Falcons years ago. Is that true ?

Yep, it's fully working, please forgive me if you see any of my
messages coming from Outlook Expres$, it's only testing ethernet
through Masquerade on my TT. ;-)

>Looks very promising.
>
It depends on the availability of pocket adaptors that use this Realtek
chip. For the moment I know Zero One Technologies (ZOT), Genius (they
call it Genius LAN) and my adaptor which says nothing on the plastic
cover (!). You can see a picture of this adaptor at Levien van Zon's
page at: "http://atari.scum.org/ethernet/"

Needless to say I'm also interested in this discussion project, and
given a hardware solution, I'm volunteered to help with the software.

Note that it's possible to make a 16 bit interface for the cartridge
port (even issue 27 of ST LOG, Jan 1989 had one ;-)) using the same
chips I've used for this project, with speeds up to 200KB/sec. But
I'm not sure if it's possible to connect ISA cards on this.

For the moment, I don't know how I lived without ethernet all these
years ;-)

AFAIK Uwe Seimets HDDriver can handle this! by BIOS support you are
refering to
the PC I think
re: Atari hyperformat, only atari can read this anyway?! If you format
an LS-120
disk in hyperformat, you will only be able to use it on an Atari, which
is nothing
to do with LS-120 at all, but an atari issue. stock PCs can't read mac
disks,
extended format atari disks, etc so why woyuld one expect everything to
change
with a different floppy drive?

> getting harder to find. Any assistance would be greatly appreciated.

Canï¿½t help you with steinberg hardware, never see that before.

First:
With AHDI, doasnï¿½t create "holes" in the following of SCSI IDs.
Use ID0, ID1, ID2.. AHDI stops scanning IDs if they found one
unused ID on the bus. All other IDs after this "hole" doasnï¿½t
work.

Also use ID7 for the computer (host) and 6 for your zip.
Older ZIPs only have ID6 OR ID5.

Do not use ANY SCSI ID double!! That doansï¿½t work!
Any ID can be used only in one time. Any device must have another ID.

Second:
SCSI ZIP needs PARYTY an an active TermPwr (+5V) line on SCSI bus.
Older SCSI ZIPs doasnï¿½t deliver TermPwr, so the drive canï¿½t
terminate the bus.

One single SCSI device, or the LAST SCSI device on bus must be
terminated.

And last:
HDDriver contains some features, specialy for zip media..

1566. Re: Minix shutdown

Newsgroup: comp.sys.atari.st
Date: 1999-07-05 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <7lqqic$pe0$1@news1.xs4all.nl>
Source record: 76339

Problem was: after reboot messages concerning things worng with
Miniox filesystem partition.Were repared.

Even with the N.Closure from N.AES no good.

Advice: user newer MinT stuff for everything.
Done. Litte bit better. Now message let me think: i do a good thing
namely 'connecting an orphaned node'.

Advice came: use 'shutdown'.

Now I have the shutdown in the menu for desktop Thing together with
N.Closure and NChres.

This really does it.

Thing cosele gives : shutdown eminent' and next reboor: no complaints
about nodes of Minix.

Thank you all for the good advice.

I see that in the mean time this thread I started goes more and more
off-topic... :-)

Met vriendelijke groet,
Ronald van der Kamp

Hello!
I got a falcon and i have bought the HDDriver for it and I am going to use the computer mainly for the Cubase Audio programmin'! The hard disk is a Quantum fireball, I have one question: I have problem opening CAF after instaaling HD-driver, why ? Do someone have a solution how to configure the falcon? Thanks for answers! Oystein!

Hi

Unless they are using a colour emulator such as big colour, otherwise I don't think it's possible! You can't even use the TV with an SM monitor connected!

>RSC NOT FOUND, yet everything is there.

With Newsie you must use '193.190.204.128' without the ftp://.

You can also use 'chapelie.rma.ac.be'
Starting dir: atari
Logname: ftp or anonymous
Password: your e-mail address.

I use this address because every decent mailreader is able to launch the
browser if one click on that address.
Okami, MyMail and aMail are all able to do that. I don't know about
Newsie. I don't use it at all.

>putting up a website of their own.

Agree with you. Wensuite is getting better and better but there are still
lots of things that must be improved before it can replace Cab.
For instance the handling of frames. It's maybe my fault but right now
only the main frame has a scroll bar. This means that if I want to
scroll down another frame I must first click inside that frame and then
return to the scrollbar on the right side. Very strange way to handle.
Furthermore Wensuite still doesn't understand lost of Tags.

For instance <A TARGET="_blank" HREF="bla_bla.htm">bla bl</A>

This TAG will cause the link to be loaded in a new blank window. Cab does
this very nice. Wensuite not.

Wensuite beats Cab when it becomes to rapidity.
On my HD I've a webpage with lots of large JPG's (13). I did measured the
loading time. Remember I'm doing this on a Hades 060 with 'copy back' on
and running in 256 colormode.

Cab 2.70e needs 6:59 (almost 7 minutes)

Wensuite: You won't believe it: ONLY 0:16. Yes, you see it right, only *16
seconds* to load the same page. Whow is that fast.

1571. MEGA ATARI USER LIST !!

Newsgroup: comp.sys.atari.st
Date: 1999-07-05 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3780FC57.2C05@geocities.com>
Source record: 76344
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Fellow Atarians,

In April I put out the word for contributions of names and E-mail addresses for a MEGA ATARI LIST, and I'm happy to say that after getting married and much mundane work, I finally finished composing and organizing the near hundred contributions for the United States of America list.

Coming soon, Canada and other parts of the world, and most importantly... a URL location to access this list at any time.

Keep those submissions coming!

Doctor Clu
Arlington, TX

/|\ M E G A A T A R I U S E R L I S T /|\

Have you played Atari today?

The following is a list of those who have. A list like this was made possible so that people could stop feeling like they were a solitary Atari user/player and meet up with some other people.
From this, other people/vendors could be found, swapping encouraged amoungst collectors, and possibly meetings and user groups!

Neat idea? Then why not jump in! To join, please send the following information to Greg@atariusers.com

NAME:
E-MAIL:
LOCATION: (City optional)
COMPUTER: (Optional)
COMMENTS: (Optional)

Only vendors will have a complete address or phone number listed. Everyone else, out of respect and caution, will only be listed by state and E-mail for contact purposes.

You can find information in this document quickly by using the "find" option in your html reader/word processing program, and key on the following words. You can also search by state.

Hello,
Haven't heard of any such problems. Does it work if you use AHDI as
harddisk driver or is it the same?
Which model of Quantum Fireball do you use? There are some problems with
them - check at my site for some more info and some troubleshooting.
Configuring the Falcon: Start by removing all ACC's and AUTO-folder
programs, so that your boot is completely clean. If you have an S/Pdif
interface, you need the FDI_INIT.PRG in the AUTO-folder though.
If you have one of the Fireballs that may give you problems, use an
NVRAM setting utility to remove the arbitration and you'll be better off
for the time being...

In what way is Atari Computer back? Whats the market for this box?
Marketing budget? Distribution Channel? Will they have an Atari store
with in a store at CompUSA. Will they have Atari Computer Reps calling
on the retail/business stores?

Price? $1,000 plus monitor is in Imac territory....Why 68k chips in
1999?

1576. ST Cartridge Port Interface Falcon Compatible?

Newsgroup: comp.sys.atari.st
Date: 1999-07-06 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7lrrts$2m13@news.ajou.ac.kr>
Source record: 76259

Hi folks,

Was looking at a DIY cartridge port interface for a ST in the
January 1989, Issue 27 of ST LOG Magazine.

This looks like a interesting project and was wondering if this
interface would also be Falcon Compatible?

If it is not, anyone know how to modify this interface to make
it Falcon Compatible?

Also, I'm always interested in projects similar to this, if you
happen to have any DIY projects like this for the ST and or Falcon,
then I would very much like some information about 'em.

Thanks,
phantomm@kih.net

Yes, but.. a long way.

Better is to find +5V on the SCSI adaptor.
Following smal circuit allows to generate "TermPwr"

Fuse Sinlge
1 Amp Recifier (diode)
+5V o----####---->>>>------o TermPwr Pin on Bus

Hi, I'll second that. Only thing is Munpack or Newsie doesn't display
all the names while unpacking... Suppose there's file1.xxx, file2.xxx
and file3.xxx in the bunch, then the display says "decoding file1.xxx" and
that's it. When looking into "work", the others are there also. Sometimes
they're simply called part1, part2, part3 etc.

1581. SCSI-drives, again

Newsgroup: comp.sys.atari.st
Date: 1999-07-06 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <37819d7e18baa810@holleman.demon.nl>
Source record: 76264

Hi,

we were talking about those SCSI drives recently. Remember I wrote in here about these IBM drives, 0663 and 0664?

According to IBM's support site, the 0664 M1H is a 2 Gig differential SCSI device.
Now I was looking at the specs on the Blue-Planet site, it states that the type is a Fast SCSI-2 type, with a differential SCSI *option*... Also it talks about the drive using LRC, which is Longitudinal Redundancy Code between the host and the drive. Perhaps *that's* been the reason why the drive wouldn't communicate with the regular drivers I've been trying (SCSItools, ICD-Pro and HD Driver). Maybe Uwe can shine some light onto this stuff?

As a side note the MTBF time for my 2nd hand Seagate ST12400N is 500,000 hrs... power on, that is. It probably survives me :-)

Since all those drives usually come from mainframes, running 24 hrs/day I'm not too worried about problems. My system runs 24 hrs/day too, I still reckon that to be the best for all the hardware. I bet drives spinning up 3, 4 or 5 times a day quit sooner...

hallo!

Takk for ditt svar ang. HDDRIVER/CAF p&#65533; newsgroup'en til atari. Jeg har n&#65533; et nytt problem, det er: N&#65533;r jeg setter inn HDDRIVER original diskett og booter opp derfra, og deretter starter hddriver.prg, kommer det opp bomber og den avslutter s&#65533;k etter HD. Hvis jeg booter opp fra en annen diskett skjer det samme. Det virker som problemet ikke ligger i boot kontroll, jeg vet ikke helt! Jeg skal pr&#65533;ve igjen p&#65533; nye m&#65533;ter, men hvis du kan gi meg noen flere tips er det flott!

It will be TOS 2.05 or 2.06. Does the system perform a memory test when
you switch on?
If so, then it's 2.06.

> i
> have an SH204 hard disk unit from a 1040ST that i'd like to use with the
> STe; the drive works fine with the 1040. i'm guessing i need to load a
> driver on the STe.

Think about it. Where exactly do you think the driver will need to be
loaded? On the disk!

Therefore, if it already works with the 1040ST, then the drive is
already configured and has a driver set up.

> can someone point me in the right direction on this one?
> the operating system on the 1040 (and i'm guessing the SH204) is something
> called BOS 5.1

Erm... You sound confused.

On Atari systems, the operating system (TOS) is in ROM chips inside the
ST, not on disk. What does go on the disk is the hard disk driver. When
you switch on the machine, it basically checks to see if a drive is
connected, and if the disk has a driver. If so, it loads the driver and
you're set.

I've no idea what BOS is, it could be some kind of HD driver, but I'm
pretty sure the ST is running TOS, unless some previous owner has hacked
the ROM chips.

Oddly, I have seen this, but I don't quite know what it is either. i
recieved it along with my Mega2 a few years ago from the previous
owner. BOS is Buisness Operating Software by BOS Software (I'm copying
this from the diskette label)

ATARI ST BOS SOFTWARE BACNAT

BOS/BOOTSTRAP DISKETTE (ROM BIOS)
SERIAL #######
FIRST DISKETTE DRIVE format TOS
ATARI REDEMPTION VOUCHER SYSTEM

All on a SS/DD diskette. I remember it had a TOS.IMG on it as well as
some other things. Perhaps a variant TOS for the early romless 520STs?

Hi Oliver

When installed, every version I have tried including WS_FTP Pro Explorer v6, has as the DEFAULT that files when copied end up UPPERCASE. I presumed that the case weren't changed at all. My problems happened when I started using WS_FTP to upload my web pages. On the good old reliable Atari using Newsie, I never had a single problem.

Look for 'force lower case remote names' in the configuration, if this is NOT ticked everything written/uploaded with be UPPERCASE.

Hello Ken,

m> disk in hyperformat, you will only be able to use it on an Atari, which
m> is nothing
m> to do with LS-120 at all, but an atari issue. stock PCs can't read mac
Hmm, maybe (obviously) you don't use a LS-120 on a PC.

Nor are the DOS/Windows drivers of the LS-120 capabable of using Ataris
hyperformat (even if the PC BIOS is able to handle that), neither is it
possible to read *standard* Atari high density disks (which differs a
little
from standard PC high density disks).

PS: Sure, what a floppy can read is most times a matter of the controller/

driver and not a matter of hardware (except the somewhat outdated GCR
which
you obviously meant by "mac discs" long time ago). But thats not really
new.
;-)

I told you this already in a previous message. With a ftp program you MUST
use "193.190.204.128", no ftp.xxx or ftp:// or whatever.

ftp:// can be used with a browser.

As adviced I now use 'shutdown' for the MiNT stuff and indeed the
Minix partitions stays OK.

But it all started with the wish to have my new Linux partition also
available.That also works now. But....

a 'shutdown' under MiNT result in complaints when booting the Linux.
Same kind of problem I had with the Minix partition. The partition is
not closed the last time it was in use as it should be according to
Linux ext2-rules it seems.

Shouls I go to a Linux 68k newsgroup to get more info about this
aspect of Atari behaviour?

Met vriendelijke groet,

Best Electronics will probably have the cables in stock. If you really want to make one yourself(not over 3'), then I have the connectors with hoods in stock ffor $3.00 each(1M and 1F needed) plus shipping. Overseas extra.

Well, the old URL is still valid and spits out a /temporary/ redirect to
the new one. I wonder whether this is really what they want ...

Ciao

Your best bet would be to use a MIDI-CV converter such as the Kenton
Pro-Solo (the people that sell them should be able to point you at someoen
who can mod it to use the extra CV output for accent and thene sequence it
with MIDI...alternatively if you just want to synchroniose it then all you
need is a MIDI to Din Sync converter. The pro-Solo will do it but there
are cheaper ways...

Hello Steve,

S> Look for 'force lower case remote names' in the configuration, if this
S> is NOT ticked everything written/uploaded with be UPPERCASE.
But it is *not* converted by WS-FTP to uppercase, WS-FTP is just
transferring
the file(name)s and they *are* uppercase (what I wanted to explain to
you)!

Once again: A filename on FAT (8+3) is by definition (and by coding into
the
directory - use a disk monitor to check) uppercase. And that's what it is
on
TOS, DOS, Windows and even the first Win95 if you use 8+3 filenames (on
first
Win95 if you entered a new name "test.txt" with the Explorer, it was
written
as "TEST.TXT" and shown as "Test.txt").

What your favorite desktop/shell on every system above will ever show you,
if
the FTP programm doesn't convert to lowercase, you will always end up with

uppercase names on the server.

So if there is no such switch, it is Newsies "fault" (because it presumes

that you want to convert it), not the the one of WS-FTP (which kindly lets

the choice). If there is *really* a lowercase filename, WS-FTP won't
convert
them to uppercase - in no version ever.

Greetings, Oliver

>over an Atari chat line, then I would think it ok to create a new one.
>
>Mike

Hi Mike

In the past when #atari has been set as invite only, users used to use
#atari2. I think #atari2 is still a reference point for many folk when
#atari is inaccessible, now 2 channels are generally used: #atari &
#atariscne. You may find more life on the second channel and many users
on #atariscne are also on other channels.

There's no problem creating your own channel as this is the basis of the
IRC network, the channel will disappear when you leave IRC unless
someone takes it over.

Better: The channel will disappear when the last person leaves it. It
doesn't matter if the original founder of a channel leaves before others
do, the only difference it might make is that no one has operator
status, then, unless the founder opped others before he left.

1614. Atari System Animal Name (Humor)

Newsgroup: comp.sys.atari.st
Date: 1999-07-07 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <378397BE.F4@geocities.com>
Source record: 76207
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I like the trend of the animal names in the Atari systems, however, the earlier systems (pre-1990) did not seem to adhere to the same animal names. So at this time, I would like to make some suggestions on names we can call our computers.

Starting with the Atari ST/TT line of computers. So far we have a bird theme going here with the Falcon, Sparrow, (Phenix) and Milan, so let's expand the theme a little.

STork (Atari ST line of computers)
TiT (TT, just add an "i", actual bird name)
Sparrow (Falcon prototype)
Falcon
Milan
Phenix (legndary "soon to be released" computer)

Next we visit the 8-bit line of computers. Based on the usual nickname of the Atari 800 (The Hippo machine) we will base the animal based names off land animals. So in order it would go something like this:

Turtle - (Atari 400 - allusion to the "turtle graphics")
Hippo - (Atari 800 due to shear size)

Mule (Atari 600XL) (Was going to call this an "Ass") :)
Stallion - (Atari 800XL)
Rhino - (Atari 1200XL)
Mammoth - (Atari 1450XL)

Emu - (Atari 65XE XE's given land based bird names
Ostrich - (Atari 130XE since they were a transision to the ST)

Penguin - (What an Atari ST becomes when emulating an Atari 8-bit. Slow, but only because it's out of it's element.)

Game systems have taken a cat-like name. Suggestions would be helpful at the moment, but taking a BACKWARD progression we could deduce the following...

Tabby - Pong System
Calico - 2600 Game System
Persian - 5200 Game System
Courgar - 7800 Game System
Panther - Prototype system between 7800 and Jaguar
Lynx - 16 bit/hand held Game System
Jaguar - 64 bit game system

Cheetah - The upcoming Nuon System? ;)

So folks, let me know what you think. Are they fitting names or what would you suggest?

1616. Sad Truth About Newsie

Newsgroup: comp.sys.atari.st
Date: 1999-07-07 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37839C67.3DD@geocities.com>
Source record: 76209

I learned last night that if you have Newsie set for "deleting the mail
off the server" and it discovers there is not enough disk space to save
the mail... it will save what it can, and delete the rest of the mail
from the server.

Lost about 10 E-mail letters that way.

Suffice to say, until I get a larger harddrive, my ST with Newsie has
become a "READ ONLY" E-mail reading machine.

Lets keep our fingers crossed and hope that the " dodo " isn't added to
that list in the future;-)

1619. Rebuilding an Atari TT .. I need your help!

Newsgroup: comp.sys.atari.st
Date: 1999-07-07 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3783A08B.4A8E@geocities.com>
Source record: 76212
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.atari.programmer,stgt.atari

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be challenging.
and a few other chips/components - again, possible problem, since more than likely these chips taken
were probably rare. Anyone deal
in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

Try the link below for Pacifist, this server also has a ton of games via the
Automation and Pompey Pirates compilations.

Hope this helps

Are you sure that Wensuite didn't use the dithered-down versions of the
JPEGs produced by CAB (perhaps from a cache)? Try running them the other
way round, i.e. Wensuite first - after deleting any cache(s).

> Penguin - (What an Atari ST becomes when emulating an Atari
> 8-bit. Slow, but only because it's out of it's
> element.)

Like the idea, but i'd like to continue the bird-theme and make
some alternate (and slight irreverent) suggestions for the 8-bit line -
a few of these are borrowed from the original.....

Atari 400 Dodo - there used to be alot of these around.
Atari 800 Albatross - what it became to Atari Inc. after Commodore
introduced the cheap-to-produce, high profit margin C64.
Atari 1200XL Turkey - you need an explanation for this one?
Atari 600XL Bat - small, ugly and of questionable use.
Atari 800XL Starling - you always see at least one and usually more
at every garage/car boot sale.
Atari 1400XL Parrot - Looks nice and it talks too!
Atari 1450XLD Bald Eagle - very impressive - but have YOU ever seen one
in the flesh?
Atari 130XE Penguin - nice design, but environments where it could
thrive were diminishing.

Atari 65XE Pingu - a baby Penguin
Atari XEGS Ostrich - maybe if we stick our heads in the sand Sega and Nintendo will just go away.
Atari 800XE Big Bird - okay, so now this is just getting silly.

Graham

Not meant as criticism, but what's so nice about FDT?
It's sloppy and slow. Even at 19200 it looses characters.
Tried it as a TTY to a Linux machine, no good it was...
Maybe my version is too old?

The best comms program seems to be Connect, and it's free too!

Just your typical 'why isn't it a mass-produced, mass-marketed, over-hyped
product just like the Muck or PeeCee?' response from Sinplop. I bet that
Sinplop has NEVER shopped in a place where niche markets are catered for.
I also bet he has only shopped in the biggest shops because thats where
all the other sheep go...makes it easier for Micro$loth and Macintoss to
center the crosshairs...

Guess what? I'm having lamb for tea tonite!! (manic laughter in background)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

I don't know much about IRC, but a buddy (who lurks only now it seems)
and I created a channel (I guess) just by logging on and typing the
name. Is that wrong to do? If I join "#ATARI2", a new channel is
created and I can talk to another. If assholes are allowed to take
over an Atari chat line, then I would think it ok to create a new one.

Mike

I had the same a weekago but I ended up with a number of <no
subject> mails of 0 lenght.

After spacing up the disk and a retry all mail was still on the
server for download. I have 'delete mail' also on.
But I am a relict: newsie 0.86

Is this likely to be any faster than just running MPC 1.2 with NVDI-PC? Do
NVDI-PC's graphics acceleration bits work with Gemulator?

MPC/NVDI-PC is entirely usable, speed-wise (may be no great shakes if you're
used to an accelerated Falcon or TT, but it's dramatic after an 8MHz STE -
all that and colour, too!). I'm just getting impatient for v6.x which is
supposed to be vastly improved in both the speed and other departments. The
German version seems to have been out for yonks, but no sign yet from
SysSol, unless there have been developments very recently.

>
>This looks like a interesting project and was wondering if this
>interface would also be Falcon Compatible?
>
Yes, it normally is, the only obscured point is the use of LDS/UPS to construct the A0 line. My tests developing my board for ethernet showed that the behaviour of those signals is different between ST Falcon and TT ! There is of course the posibility to have measured something wrong, but finaly I ended up using line A8 for an 8 bit interface.

>If it is not, anyone know how to modify this interface to make
>it Falcon Compatible?
>
It depends on what you like to do with it. Using it 'as is' you can and some logic to ensure that ROM3 and ROM4 signals (logic high) are pulled down last (ie after all other signals have settled). This is the only thing that has to be done (only for writing).

>Also, I'm always interested in projects similar to this, if you
>happen to have any DIY projects like this for the ST and or Falcon,
>then I would very much like some information about 'em.
>
Check my homepage for the cartridge to printer port interface.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on weight/distance. Large orders will be weighed as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi, i have a variety of Stacy bits to sell/exchange.
Includes (suggested price in pounds) -

SCREEN - (20)
POWER SUPPLY - (20)
FLOPPY DRIVE - (8)
KEYBOARD - (10)
(all tested and working)
MOTHERBOARD (20)
(believed OK but unable to test)

Some other bits like cables etc, email me if you're
interested in a specific bit. P&P extra (some bits
heavy/fragile).

Regards, Steve.

Hello folks,
what about girl names for the atari computers ?!? Some are already given
for computers or chips: Sally (CPU), Sandy (??), Maria (7800 gfx chip),
Candy (not Strip-Poker this time !!), etc. Greets - Andreas

P.S.: It is always better to give your atari computer a girl name, than
your gun/pistol...

On 7 Jul 1999 14:46:35 -, Doctor Clu wrote:

<snip>

-> Alright, the way I see it, the parts list is looking like this:
->
->Missing list:
->
->keyboard - I have a Mega ST keyboard. Would this be compatible?

Yes, the Mega ST, Mega STe, and TT keyboards are all interchangeable.

->floppy drive - No problem.. common.
->TOS ROMs - Possible problem... anyone know of anyone who burns these?

Tad bit expensive but Brad at Best Electronics sells TOS chips
(all varieties)

->Hard Drive - no problem.. common.. though the cables from the
-> motherboard to the hard drive might be a problem.
->Hard Drive Mount/shell - One could be fashioned to fit... might be
-> challenging.
->and a few other chips/components - again, possible problem, since
-> more than likely these chips taken
-> were probably rare. Anyone deal
-> in ST/TT components?

Ditto. Best Electronics will have just about anything you need.

->cords - From computer to monitor/hard drive.. little problem
->mouse - absolutely no problem.
->other cables - "other" cables? Internal? Possible problem.
->
->As for what's included... "68030 processor, power supply, VME cage, all
->connectors on back including the VME cover plate with two serial ports
->mounted on it. "
->
-> I'm relieved that the processor is there, and power supply... my only
->question is how good the motherboard and power supply is.
->
-> So these are the parts of the puzzle. I'm curious to sources for TT
->computer components, and where I can find specs so I can know what other
->parts I need to look for.

Qfunk has a web site dedicated just to the Atari TT. Its URL is:

http://www.megacom.net/~q-funk/ (I think)

Also, here is the Best Electronics info (BTW, I highly recommend you
purchase their catalog-its big, has great pics, and is ultra cool!):

-----BEGIN PGP SIGNED MESSAGE-----
Hash: SHA1

I have to plead ignorance on the emulation on a G3. The only thing I've done is run a couple of the ST emulators on my PII-350 system. TOSBox reports approximately 135MHz equivalence (running under Windows NT 4.0 SP5).

My interest at the moment is primarily in running the Sozobon compiler and comparing the output .o files to a version I have compiled to run as a cross compiler on the PC. Needless to say the PC emulations are plenty fast enough for such trivial operations!

Almost brings back memories of my original 520ST and compiling with Alcyon C and a single low density floppy! :-)

I do think that the value of the standard connections (serial port, parallel port, floppy, network etc.) is a significant advantage of the PC over the G3. If it emulates 10x faster but you gotta jump through twenty minutes worth of hoops just to transfer one floppies worth of data to it... the performance advantage seems to be lost quite quickly.

I'm thinking about the G3 in the context of my current desktop systems. For example, the PC systems I'm using have between them:

- Hauppauge TV/FM tuner
- Linksys PCMCIA slots
- DVD-ROM
- Hardware MPEG decoder card
- SCSI CD-ROM and CDR
- SCSI flatbed scanner
- SCSI HD
- SCSI DAT drive
- IDE HD
- 3.5" floppy
- 5.25" floppy
- ZIP drive (parallel port)
- laser printer (parallel port)
- Adtron solid state data drive (parallel port)
- USR 56K external modem
- Xircom 56K PCMCIA modem

Needless to say not many of these devices would be available for or fit in to a G3 - but with a $50 dual parallel port card I could theoretically cram all of these into my one full tower case and with

Windows NT providing the abstraction layer I could use all but the
MPEG decoder and TV tuner (and maybe the scanner) from the Atari
emulator. I personally am willing to settle for reasonably fast
emulation and the ability to use those devices rather than flat out
speed and not even have a floppy disk or a serial port...

It sounds to me like most other folks reading this group have far more
serious or specific performance requirements than I do.

Regards,

Dan Haynes

>way round, i.e. Wensuite first - after deleting any cache(s).

Yep, I'm pretty sure that Wensuite didn't used any cache and so did Cab.
I ran the test again the other way round.
However Wensuite used my standard system font (Monaco) during my previous
test. I've changed the setup so that both browser used the same fonts
during the test now.
As with the previous test I've used 256 colormode and the Hades cache
"Copy back" enabled.

Wensuite: 00:16:55 (nearly 17 sec)
Cab 2.70e: 06:55:11 (nearly 7 minutes)

I also have loaded a 489.325 bytes jpg picture in both browsers.
Wensuite: 00:02:75
Cab: 00:06:15

For your information with Gemview it took 00:07:20
Graftool did the same job in 00:04:22

Convinced now:-))

Yep, this thing is a lot faster than anything else I have tried on the Atari. I just hope it will get improved support for frames, and a couple of other stuff mentioned here, real soon. It asumes target="_top" if nothing else is stated, and this causes a lot of troubles on some pages that are written to be used both with and without frames. (I know, my page does)

Anyway, it look very promising. I&#65533;m not sure if it is a CAB-killer or not, but it might well be. (If CAB isn&#65533;t dead already....)

;)

I downloaded TWO versions of Wensuite 3.*** beta- and neither did work
on my Mega ST (4MB, TOS2.06). Both versions showed two bombs immediately
after I clicked on the first OK.

Then I found somewhere version 3.10a (not a beta, but unregistered, of
course)- and it works. Unfortunately, offline only. Which is a pity.
That program had a bad reputation, and they should have released a
non-crippled version or two to hook users back.

And it is VERY FAST endeed!

Cu.

Freeze Dried Term is the best terminal program that I have used. It's lightning fast with the Nova graphics card. It has some problems in the 256 color mode of the Nova graphics card and doesn't work at all in the 32k and true color modes. I have used it up to 31k with no lost of characters whatsoever using the Monoco font in NVDI and with some of the fonts that came with Freeze Dried Term registered version. Sure wish it was still supported.

BTW, the problems I have while using the Nova card in 256 colors are in the editor and capture buffer commands using the drop down menus; keyboard commands work OK though.

None of these are beta. The latest number is 3.12b, where the letter b
stands for a minor release or bug fix, not beta.

FWIW, the archives you find on the net are updates. You need a serial
number to activate the PPP Link part, otherwise it runs as an
offline-only demo.

Some of the early version 3s had a bug on some systems that made it
crash as soon as you opened a window.

It's an AUTO folder program that installs a JPEG decoding routine that
uses the DSP. I beleive it's used by CAB and probably some other
programs.

Thanks there Chris and definately DarkChyld. This is pretty cool.
I'm having fun getting the pieces together on this. Best Electronics
was good at getting all the pieces for a Atari Portfolio. (Battery
and port doors, and keyboard underlay.)

Portfolio, that used to be in sorry shape now works great and I
would be using it if I didn't have a Newton 2000. ;)

And I think I have a lead for the TOS ROMs... still waiting to see
what shape the motherboard is in and what else I'll need.

Exciting... ;)

Image Copy views, prints and converts BMP picture files to just about
anything, and of course it runs just fine on a Falcon! :-)

Kind regards

In the "edit server" dialog I have just the string of numbers as the server address (other details etc as you wish), with the starting directory set to /atari (this can be adjusted to your requirement also). It has been noted that sometimes you have to press the [Esc] key to get NEWSie started.

> BIOHAZARD a ï¿½crit :
>
> What's TOS? AtariOS? What kind of interface? MacOS?

Wow! You're lost!

First of all, please get rid of that HTML setting.

TOS is "The Operating System" that's used in the Atari ST range of computers, from the original 520ST to the Falcon, TT and modern day Hades and Milan. There is no such thing as "AtariOS".

The user interface is actually based on GEM from Digital Research, but has evolved quite a lot since it first came out. It has nothing to do with MacOS.

There is no official TOS 6. TOS 4.04 was on the Falcon, TOS 4.5 is what is being developed for the Milan. I think the Centek, who builds the CenTurbo 2 accelerator board has something misnamed TOS 6, but it is actually a patched version of TOS 4.04.

> price.

Well, you still need a SCSI adapter for the G3 (more $$$ and one less PCI slot)- and the case doesn't look like it would have enough space/power supply for all those peripherals. I guess I'm mostly pointing out a difference in design targets - the G3 is targeted at a certain market whereas PCs are more "generic" - you can get whatever sort of case, power supply, peripherals etc.

> R>It sounds to me like most other folks reading this group have far more
> R>serious or specific performance requirements than I do.
> why so sarcastic?

No no! Not sarcastic - it was an observation on my original post! I read quite a few posts after I had posted my response and saw many that seemed to be using the Atari for recording and other "serious" purposes. I hadn't imagined/considered anyone using them that way at the time I posted.

> For me counts: working speed while my fingers are on the keyboard and my
> eyes are on the screen and waiting for the results.

For me, I never know what sort of work I'll be doing next. Everything from writing NT drivers for GPS boards to prototyping embedded kernels to bug fixes on old embedded controllers. So I value the ability to import those antique 5.25" disks without having to dig out my soldering iron! :-)

But all my ranting digresses from the '.atari.' part of the newsgroup name... so I will close by saying I wish someone would build Atari clone and Mac CPU cards for passive backplane systems - then I could unplug my x86 CPU and plug in a Falcon or a G3! :-)

1692. Cutting out Text to a File

Newsgroup: comp.sys.atari.st
Date: 1999-07-09 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7m540s$7gp1@news.ajou.ac.kr>
Source record: 76175

Was wondering if there is any easy way to cut out a block of text
and save to a text file within programs such as Cab.

I could really use this when on different Web pages when I only need
to save a paragraph instead of the whole web page.

This would also be useful with other programs as well.

ImageCopy sort of does what I'd like to do but it only saves out
to a picture format.

Any other programs that will cut text out of other programs?

From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37861F24.1925@geocities.com>
Source record: 76179

I'm starting to wonder about that myself when it comes to the Atari realm. I've been trying my usual clipboard tricks of block copy, paste, etc... moving a line of text (cut and paste) between documents. However, in the rather simple and elegant TOS that our machines have, this feature does not seem to be innate.

Was there a multi tasking operating system addition that made this possible?

1700. Blit-problems with MagiC-Mac

Newsgroup: comp.sys.atari.st
Date: 1999-07-09 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <7m5lva$k7b$1@nnrp1.deja.com>
Source record: 76183
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Greetings all,

I wonder if there is any reason why using copy raster (vdi-function 109)
wouldn&#65533;t work with MagiC-Mac? (The routines I use are taken
from ictari-10 if somebody still got these lying around somewhere)

I use this function to enable fast redraws in a program I have been
working on for a while now, and have been told that my blit-redraws
won&#65533;t work at all with MagiC-Mac.

This sounds very strange to me, as I myself have verified that
everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
something special about MagiC-Mac that can cause problems like this?

I would really, really appreciate help on this one!

Ok, all for now!
Have a nice summer,

/Joakim

1701. CAB 2.7 Freeze Up Problem - SOLVED!

Newsgroup: comp.sys.atari.st
Date: 1999-07-09 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7m5da0$2439@enews4.newsguy.com>
Source record: 76184

A couple weeks ago I mentioned my occasional problem of CAB 2.7 freezing up the FIRST TIME I try to use it after booting a COLD computer (after that it works fine). Remember?

Anyway, I figured out what the problem is:
*However, I would also mention that someone here (I forgot who) mentioned a problem with CAB and the DSP loader as a response to my original question - which helped lead me to the cause and work around solution. Thanks!

It appears to be some sort of conflict between MagiC 5 and the DSP JPEG loader from Brainstorm. I say it's a conflict of these two things because I don't get the freeze ups under normal TOS. And the Nemesis isn't a factor either as I had originally thought.

And it isn't just CAB 2.7 that freezes the computer (which is one of the things that helped me figure this out). I also use the DSP loader in Image Copy 4 (which obviously allows you to use it for faster JPEG loading). If it's the first bootup of the day on my Falcon, and I run Image copy and try to load a JPEG - freeze up city. However, much like the freeze ups with CAB, after a reboot, I can view as many JPEGs using the DSP loader as I want. It's just the first attempt after booting a cold computer that causes the freeze up.

This can also be seen when using the JPEG.ACC that comes with the DSP loader. When I had that viewer installed as an application for JPEGs on the desktop (a while back), the computer would occasionally freeze up when attempting to view a JPEG. I could never figure out why, but I knew it only happened under MagiC. At the time, I just uninstalled it as an application, and used something else instead. And back then I was still using CAB 2.5, and I _wasn't_ using the DSP loader JPEG OVL - so that's why CAB never froze up!

So it's not a CAB 2.7 problem, or a CAB 2.5 problem. It's a DSP JPEG loader [under MagiC] problem. Take away MagiC 5, no problem.

Now, I refuse to give up use of the DSP loader because the speed difference is MAJOR (especially with Nemesis). So I've figured out a little work around: If it's the first time I turn on the Falcon that day, I'll boot with MagiC 5 and Nemesis, load CAB 2.7, connect with STinG, then begin loading a web site (usually my own since I know it uses a couple JPEGs on the home page). However, I only let it bring it a small amount of data, then click "STOP" in CAB. After that, I reload the page, and everything works as it should. No freeze ups.

Problem (more or less) solved! I hope this helped someone besides me.

But, can anyone tell me WHY this DSP JPEG loader only chokes the first time you try to use it, then works fine thereafter!?!?

-Paul

>currently widespread commercial version of QNX, and because it's a
>relatively small company designing a mission-critical kernel for factories,
>NASA, etc., licenses are very expensive. Expect that to change,
>however. ;-}

Yes, Neutrino was designed to be put into ROMs of embedded computers.
Concerning the price of the licenses, they are really very high, a complete
development system may cost several kilodollars). Which is unwise,
in my opinion. The QNX company should have made it cheap and available,
even tolerate piracy for a couple of years, until this reliable OS
became widely spread. THEN they should have thightened the screws.

Btw. it is worth taking a look at the QNX demo that is available at
http://www.qnx.com ; the archive unpacks to one 1.44" floppy disk.
The PC is then booted from this floppy and installs some sort of RAM
disk with QNX kernel, a file system, Photon GUI, some small demo programs,
TCP/IP and a completely functional Web browser. Minimum hardware requirements
are: i386 CPU, 8MB RAM, VGA graphics, 3.5" floppy. Hard disk is NOT needed.
The catch in the demo is: you can't save anything to any real disk.

On 4 Jul 1999 14:47:33 GMT Martin Graiter wrote:

>> the future of Atari may vey well be in emulation.

>...
>Besides, the TOS is hardly a jewel among OS:es!
>...
>Not much to emulate...

A good question, and not easy to answer. It is true that TOS was almost
obsolete on the day it first appeared. But somehow, this collection of
stupid software blunders and half-baked hardware made a very handsome
and usable computer which all of us here like for some reason or another,
or else this newsgroup would not exist anymore.

>There are some rumors about a port of GEM to Linux, actually by a bunch of
>crafty Swedes...

An atari OS based on QNX kernel was just a thought, but now it seems that
meny ingredients become avalable: it's likely that Neutrino will become more
common, GEM is being ported to Linux, there is an Atari emulator (STonX) for
Unix-es, there is a Unix-like TOS extension (Mint) and file system for the
Atari line, QNX now runs on PPC chips, etc.

Again, why bother? Well, I really think that here are some very good
and comfortable to use applications for the Atari platform... and
development of an OS should be cheaper than development of a saleable clone.

>Most of the harware in a PC is sharable and not specific for the PC.
>The PCI and ISA buses are more or less generic and can be included in most
>designs. So are the memory modules, graphic cards, CD players etc.

Sure. I did not express myself very precisely. Yet, when one thinks
of, for example, a PCI card of some sort, one usually looks among the
"PC" dealers, because they are the most available ones.

>An emulator is no gain. Just messier and more cramped than the original
>system. Nostalgia and very special odd programs are the only justifications...
>Atari clones? These could have some more justification in some cases.
>Specialized niche applications could find it's customer base.

A good point, but it need not be so, if an emulator is properly made-
in which case it perhaps stops being an emulator and becomes an alternative
OS. But there are another reasons that, I think, justify the use of emulators:
* The availability of second-hand Ataris is dwindling;
* It may be much cheaper to configure an emulator than to buy an Atari clone.
* Users may be quite used to certain environment and specialized
applications that enable them to do some work efficiently, and they do not
wish or do not have the time to switch to another platform.

>When looking at the specifications for the Phenix it reads that they've
>disposed of the printer port and the serial (RS232) ports. Centek suggests
>bying USB to parallel adaptors and the same for the serial port.
>Does it not remind of the cheapo "ACSI" port on the ST:s? You had absolutely
>no use for it unless you bought expensive SCSI adaptors.

Yes, and similar to what Apple did with the iMac peripherals and interfaces.
It is very disrespectful of the customers, and I think that such approaches
are the doom of such machines sooner or later.

>QNX was included in the current issue of the german CHIP magazine's CD,

Really? Do you know what of QNX is on that CD? A computer magazine here
made a similar announcement for a CD they published last year, and it turned

out that they put the QNX demo from QNX web site on the disk.

>> And then, someone may design a nice Fuji-logo sticker to put on the
>> computer box, and one can have a feel of a real Atari, especially if the

> Yes, and one can put these logos on a grey car and have a feel of riding in
> an Atari limo... :^)

Yeah, and aren't most of those F-16 and F-18 fighter planes painted in a
similar shade of grey :)

My pun was aimed at the extremists who swear they will never use anything
but a "real" Atari hardware.

On 4 Jul 1999 17:18:15 G, Johan Klockars wrote:

>STEmulator in GDI mode is about a trillion times faster at VDI graphics,

Any link to STemulator available? I am not familiar with that emulator.

>>* Some programs do not work:
>Well, some programs don't run on all native Atari machines either.

That's true, but when some essential utilities like the LZH shell, or a
classic program like Megapaint do not work (they both have problems
with file-selectors under PaCifiST), it is a bit too much.

>>* Screen refresh and mouse movements are slow and jerky:
>Converting byte/pixel graphics to the Atari bitplane modes can be done

>to be the least bit slow,

It may be so, and yet the screen and mouse are slow. Maybe it is just
poor programming by authors of those emulators.

>>* Floating-point performance is very miserable:

>new instructions. I seem to recall that GEMulator supports the
>newer processors

The docs say so about GEMulator, but only for the commercial version.
Nothing in the docs about the FPU though; But there is another type of
FPU connection in Ataris- the so-called "memory mapped processor" like
something that was called "SFP004", and they work with MC68000. I made and
installed such a unit with a 12MHz MC68881 into my Mega ST,
and it speeds some programs by anything between 400% and 1600%. As most
emulators imitate MC68000 only, I had in mind an emulation of at least
such a connection of the FPU.

>>I would like an emulator that operates on DOS stripped off of all things
>>unneeded, maybe keeping just that couple of system files, and some device
>
>No, you wouldn't.
>You wouldn't have access to much (if any) graphics acceleration on such
>a setup, for example.

But maybe I still would like it. In that case I would not need a lot
of Windows files and disk space, and the whole setup would be very compact,
for example, if an "obsolete" PC is completely dedicated to Atari emulation.
Much more important, there would be far better chances for precise timing
in applications that need it (for example, like those that musicians use).
It seems that DOS can be the base for for real-time applications, and Windows
(any breed) simply can not.

>>Or, maybe, one can dispose of DOS completely, and use just a little of
>>PC BIOS to boot up, and after that dispose even of the BIOS. The compact QNX
>
>That would be absolutely silly. And you probably wouldn't be able to
>access most of the hardware on the PC either.

The mentioned QNX, for example, accesses all that hardware very nicely.
I admit that there might be a problem of (non)existing device drivers
in a "new" OS.

>One of the main ideas about operating systems is to abstract the hardware
>from the applications. Windows does that to a much higher degree than DOS.

But in this particular case we do not need an universal application
but, in fact, an operating system, something that can run most Atari programs,
and efficientlly squeeze every bit of performance out of the hardware.

I have no problem with the BrainStorm DSP loader under MagiC 5.11,
though I don't use the DSP version of cab_jpeg.ovl (since it doesn't
support progressive JPEGs).

Make sure you're using the latest version of the DSP loader. I
believe it has a date of December 25 (not sure of the year), which
will display when it boots up.

Maybe you could just view a JPEG with another app using the decoder,
say 1STGuide, and then no more need to get connected with all the
drawbacks in case of a freeze. And it's far quicker than launching
Cab.

> But, can anyone tell me WHY this DSP JPEG loader only chokes the first time you
> try to use it, then works fine thereafter!?!?

I don't know. I have also the problem with at least one soft using the
DSP and not needing the Brainstorm's decoder.

1715. NVDI5 and STe problems

Newsgroup: comp.sys.atari.st
Date: 1999-07-10 00:00:00 UTC
From: Michael Clark <mclark@ihug.co.nz>
Message-ID: <7m636s$l47$1@newsource.ihug.co.nz>
Source record: 76099

I have Magic 6 and NVDI 5 running fine on Gemulator but when I installed them on my 4 meg STe Magic works fine. But NVDI doesnt work with Magic or with TOS 2.06.
Under Tos I get the NVDI message and then the computer locks up. No bombs or anything.
I have tried leaving it like this for an hour as I read somewhere about it needing to create a file the first time its run. But still no joy.
Any help appreciated.

Mike

> Looking to buy or trade for a device that will allow more than one
> cartridge to be connected to a ST/STE.

I don't have one for sale, but I'm using a C-lab Combiner, which allows
you to switch between four connected cartridges by pressing a button on
the box. There's also Steinberg's Midex and Midex+ with four cartridge
slots, but they're probably more expensive since they also have a midi
expansion with 2 extra ins and 4 extra outs (and the + model also has
SMPTE sync built-in).
There are probably more models around, but I believe those are the most
common ones - so now you know what you should look for...

Phantomm, Pascal, DrClu...

There is a work-around for this. (until such an option is added
to CAB).

1) Set QED (or your fav text editor) as the default-viewer for
ASCII/*.TXT files. (I'm talking installed apps here).
2) Goto the web site you want to grab text from.
3) Use Mark Wherry's HTML to ASCII CAB module to send the
converted text to your system (default) viewer.
4) Highlight and save-out the block of text you needed.

Like I said, its a "work-around" until something else is
done to CAB (is any further CAB development going to happen
now that A. Clauss is supporting the MAC CAB version?)

It actually is easier and faster than the 4 steps I have
listed... ;-)

Hope this helps.

Problems with file selectors? That's strange.

>>Converting byte/pixel graphics to the Atari bitplane modes can be done
...

Could be. In any case, STemulator seems to use the normal Windows mouse
pointer in all its modes and the GDI modes don't do any strange looking
screen conversion.

>FPU connection in Ataris- the so-called "memory mapped processor" like

AFAICS, it should be relatively simple to emulate an FPU in that way.
I don't know how common software support is for it, though.

>>>I would like an emulator that operates on DOS stripped off of all things

>It seems that DOS can be the base for for real-time applications, and Windows
>(any breed) simply can not.

That could indeed be real use for it.

>The mentioned QNX, for example, accesses all that hardware very nicely.

No, it doesn't.
With a bit of luck, it _might_ be able to treat my sound card (with an
Aureal Vortex 2 chip) as a DOS mode SoundBlaster16, for example, but that
doesn't even come close to using what it's capable of.
The graphics card might be usable in VGA modes (horror!) or possibly
using VESA, but again that's far from supporting it well.
Hopefully QNX is able to access my hard disks and DVD-ROM player in DMA
mode, but even that isn't certain (Win95 couldn't do it without special
drivers).

>I admit that there might be a problem of (non)existing device drivers

There is nothing 'might' about it.

>
>But in this particular case we do not need an universal application
>but, in fact, an operating system, something that can run most Atari programs,

My statement above _was_ about operating systems.

I'm not saying that it would be impossible to run most Atari programs.
They've never _needed_ high performance hardware before...

>and efficientlly squeeze every bit of performance out of the hardware.

That's exactly what you won't be able to accomplish.

I know for a fact that vro_cpyfm() works on my Mac at work under the
MagiCMac demo, since I've run MGIF in quick VDI mode just fine.
This is in 256 colours, though.

>I use this function to enable fast redraws in a program I have been

Depending on what you mean by 'redraws', blitting may not be the way
to go on machines with graphics acceleration.

It can be very slow to copy data from the screen to RAM and back again,
while normal drawing operations can be fast as lightning.
(fVDI/mach64 does it's best to optimize such things, though, by actually
not doing the copy to normal RAM. Instead it uses free internal memory
on the card. I'm not aware of any other VDI that does this, however.)
If you're rather talking about creating a complex image of some kind in
RAM (such as for a game, perhaps), there isn't much choice, obviously,
but at least you won't need to blit from the screen.

>working on for a while now, and have been told that my blit-redraws
>won�t work at all with MagiC-Mac.

I assume you are aware of the usual problems with true colour graphics
modes using vro_cpyfm()? That is, the bit order may differ from card
to card and the only thing you can do with the normal VDI (NVDI and
fVDI have a special function) is to set test pixels, blit them into
normal RAM and see how they look (there's a nice library out there
somewhere that will do all this for you, but I can't recall the name).

Do not assume that you can access the screen directly in any way.
The screen address you can get from the Xbios may not necessarily
have anything to do with the one the VDI uses (with a graphics card,
the screen may not have an addressable frame buffer at all).

>This sounds very strange to me, as I myself have verified that
>everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
>something special about MagiC-Mac that can cause problems like this?

The main difference between MagiCMac and the rest you mention is that
the others have an original Atari screen mode or emulate one.

Ok this is how it is done:

Before opening a window I reserve memory through MALLOC for the
blit-image. I have restricted colour-depth to a maximum of 16, since I
believe the first 16 are supposed to never change due to being system
colours. (Unless restricted in this way, huge amounts of memory will be
reserved on setups with great colour resolutions.) Right/wrong?

Objects will be redrawed for the first time with a standard OBJC_DRAW.
As soon as it is written, a copy of this is placed by the VDI-function
in the previously reserved memory. After this, all redraws will use the
VDI-function to restore areas when needed.

Is this a bad way to do things? I know for a fact that using OBJC_DRAW
all the way is fast enough on newer machines, but on older computers I
feel that the blitting really makes a difference that makes it worth it.
And furthermore, I have worked a lot with these routines, and I would
hate to have to drop them at this point. Especially as it seems to work
so well on everything but MagiC-Mac.

> I assume you are aware of the usual problems with true colour graphics

Ok, but the first 16 should be the same, right?

Which calls will be affected by this, and in what way?

Sorry if some questions seems to be to simple or silly, but since I don't have a clue to these things the only way to find out is to ask. :)

Regards,

Joakim

>Hi All
>
>I have been using MagiC 6 for some time and noticed a program in the
>GEMDESK directory called MOD_APP.TTP.Does anyone know what this
>program is used for and how to use it?

From the newly translated MagiC programming docs:

----------------------8<------------------------------

What is it for?

When installing a program, usually by means of an installation-program,
this should not only copy all the associated program files to the hard
disk, but also "introduce" the new program to the system. Under GEM/TOS
this process is traditionally called "Install application" and had to
be performed manually up till now.
MOD_APP.TTP is a small program that takes on this task. It modifies the
MagiC system files that contain the application information, inclusive of
the icon assignments. The changes become active automatically at the next
start of the AES.

----------------------8<------------------------------

So basically it's for use by some installation programs.

Message-ID: <37873FB5.2805@geocities.com>
Source record: 76115

Alright, how EXACTLY does HSModem work?

HSmodem (I would guess that stands for "High Speed" Modem) allows the serial port on the ST, that would otherwise run real sloppily at 9600 buad to work great at 14.4K.

Now can anyone tell me how it goes about doing this?

Doctor Clu

(And if anyone would like to jump to the next question I'm going to ask, why couldn't this be ported to the Atari 8-bit? I would love to get an 8-bit working reliably at.. oh, 9600 buad... WITHOUT a costly Black Box.)

Hi Don,

When I use to have a TT, I remember that I had to play with the
termination on the TT motherboard. It didn't seem right (and wasn't).
I think the internal drive, and TT were left unterminated, and the
drive on the external bus was terminated. It took some playing
around, but it did work without data loss.

Mike

P.S. Haven't forgotten Sparrow AHDI, still packed up:).

It SHOULD work configured like this. All I can suggest is that you move the drives around or, perhaps, try terminating the IBM. These termination rules are fine but the TT is configured to have a "T" shaped SCSI bus which can behave peculiarly.

How do you do that? Restrict the colour depth, I mean?
I don't think I understand what you mean here.

>believe the first 16 are supposed to never change due to being system

The actual colours shown should normally be the same, but the pixels
will look very different in the frame buffer if you compare for example
the normal Atari 4 bit mode and a graphics card 16 bit mode.

>colours. (Unless restricted in this way, huge amounts of memory will be
>reserved on setups with great colour resolutions.) Right/wrong?

I don't see how you intend to get around reserving that huge amount
of memory.

>Objects will be redrawed for the first time with a standard OBJC_DRAW.
>As soon as it is written, a copy of this is placed by the VDI-function
>in the previously reserved memory. After this, all redraws will use the
>VDI-function to restore areas when needed.

OK. On a system with a graphics accelerator, your blitting is quite
likely to be slower, but it depends on what you're drawing and how much
you need to blit.

In a 16 bit mode you'll need to blit (and of course allocate memory for)
two bytes per pixel. An 8 bit mode would be one byte per pixel and a
24 bit mode three or four bytes (such modes are often really 32 bit)
per pixel.

>Is this a bad way to do things? I know for a fact that using OBJC_DRAW
>all the way is fast enough on newer machines, but on older computers I
>feel that the blitting really makes a difference that makes it worth it.

It should be relatively easy to do redraws instead of blits only in
graphics modes with 'large' pixels.

You could also do a small test to figure out if the machine is 'fast enough'.

>And furthermore, I have worked a lot with these routines, and I would
>hate to have to drop them at this point. Especially as it seems to work
>so well on everything but MagiC-Mac.

vro_cpyfm() really must work under MagiC-Mac, but perhaps some of your
code uses it in the wrong way. Your comments earlier about only using
a few colours points in that direction.

Have you tried your program in for example FalconTC, or on an Atari
with a colour graphics card of some kind?

>> I assume you are aware of the usual problems with true colour graphics
>> modes using vro_cpyfm()? That is, the bit order may differ from card
>
>Ok, but the first 16 should be the same, right?

The colours, yes, but not their actual representation.

>> The main difference between MagiCMac and the rest you mention is that
>> the others have an original Atari screen mode or emulate one.
>
>Which calls will be affected by this, and in what way?

The VDI should really insulate you from this, if you use it correctly.
That isn't entirely simple (an understatement) when dealing with colour
images in true colour modes, though.

If you never need to touch the things you blit from the screen, and
don't intend to display any colour images (as opposed to drawing things
with lines etc), you don't have to worry about any of this. The VDI will
take care of everything.
Naturally, you need to supply large enough buffers for the blits, though.

>Cab.

I think you misunderstood. I don't use CAB when I just want to view a JPEG. I use either Image Copy 4, or any of a number of other viewers. What I meant by my statement above is that when using CAB for web browsing, the DSP-JPEG.OVL is __much__ faster than the normal CAB JPEG_OVL. Therefore, I want to continue using the DSP version in CAB for decoding JPEGs while browsing.

And when viewing JPEGs with Image Copy 4, it _also_ makes use of the DSP decoder to load the images faster, as does the little JPEG.ACC that is included in the DSP loader archive, as I mentioned before.

>I don't know. I have also the problem with at least one soft using the
>DSP and not needing the Brainstorm's decoder.

Maybe it's a DSP problem as well?

>I have no problem with the BrainStorm DSP loader under MagiC 5.11,
>though I don't use the DSP version of cab_jpeg.ovl (since it doesn't
>support progressive JPEGs).

I occasionally come across a few pages where the JPEGs won't display while I'm using the DSP-JPEG.OVL (they do display correctly with the normal CABJPEG.OVL though), but for the most part, in my experience, the DSP loader displays about 90% of the JPEGs it comes across.

And I've done some speed comparisons:

A JPEG that took OVER 1 MINUTE to load with the normal CABJPEG.OVL only took around 20 SECONDS to load with the DSP JPEG.OVL. That's a major difference. Once you get used to that it's hard to go back to the normal loader!

And what the hell is a "progressive JPEG" anyway? I remember reading about them in the CAB manual but there is no explanation of what they are.

Ideally, I would like to see an update to CAB that would allow the program to use BOTH JPEG.OVLs: The DSP version _until_ it came across a "progressive JPEG", then use the normal loader for that, then switch back to the DSP loader for the rest (I mentioned this a few months back as well).

>Make sure you're using the latest version of the DSP loader. I
>believe it has a date of December 25 (not sure of the year), which
>will display when it boots up.

The JPEGD.PRG (AUTO folder program) I use has a date of December 25th, 1994, so I guess I've got the latest one.

It's a JPEG that can display a little at a time while it's being
loaded, rather than the normal JPEG which must can only be displayed
when completely loaded and uncompressed. So naturally, these are
good for websites. And in my experience, they're far more prevalent
than the 10% figure you cited. I may give the DSP loader another
shot, though, since it's been awhile since I tried it, and the normal
loader IS quite slow.

>Ideally, I would like to see an update to CAB that would allow the program to
>use BOTH JPEG.OVLs: The DSP version _until_ it came across a "progressive
>JPEG", then use the normal loader for that, then switch back to the DSP loader

That would be nice. Or simply another OVL that uses the DSP to load
both types. I'm not holding my breath for either, though.

I installed 1ST-Guide for this purpose. It lacks the above feature but
is great for text, 1st word, jpeg, img, rsc, avr files and more.

Bye,

Paul Nurminen wrote on Sat 10-07-1999 18:52 (GMT):

> I think you misunderstood. I don't use CAB when I just want to view a JPEG. I

I think _you_ misunderstood me :-). I was just suggesting you to wiew
a jpeg (with the decoder) instead of waiting a freeze in Cab and then
reboot and broke your connection. Maybe then after doing this there
will be no problem with Cab. Just a thought.

> Maybe it's a DSP problem as well?

I think so (in my case).

Bye,
/Pascal/

Yes. There are a few programs that use it. GEM-view 3.17 is the one
program that probably benefits most from JPEGD. Try loading a large
JPEG file in 256 colour mode with octree colour selection and Floyd
Steinberg dither, before and after installing JPEGD. The loading
part at the start is the interesting part! Without JPEGD a large
JPEG takes nearly a minute just to unpack into memory...with JPEGD
that reduces to a matter of seconds!

JPEGD is indispensable I reckon, especially as a GEM-view 3.x user.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi. IIRC, I got it from an Atari Computing cover disk. Its freeware,
as far as I know. Let me know if you can't find it, and I'll UUencode
and E-mail it to you. ;-)

PS BTW, Odd Skankes' excellant TextView program is great as an
installed app/system viewer for ASCII/text files. Even has
the option to cut out blocks to the clipboard built-in.

PSS Oh, its Atari Computing issue 12, and its HTML-Export.

Er, thats not quite right. Any Atari ST can run at 19.2 just fine,
with no problems. HSModem will allow even a stock ST to run at faster
speeds (like 28.8). I think it does work best with a RSVE serial
port upgrade board. I had one hooked up to my Mega ST with an Adspeed
accellerator at one point, and 28.8 was just fine. No dropped chars.,
or anything like that. Pretty cheap and easy upgrade too.

-> Now can anyone tell me how it goes about doing this?

It patches TOS's buggy serial port routines.

Sorry, can't help with that. However, it seems like I've seen/heard of
quite a few 8-Bitters (God bless'em all!) running at 19.2 on extra
hardware. Especially some of the Sysops (who are a whole different
breed-I should know!) <very big grin>

Catch ya later...

>two of work, but the connection doesn't stay active that long.

It's likely that the server is set up this way to stop people hogging connections if they aren't transferring data. I don't know much about Supernews, but if it's used by several ISPs instead of the ISPs providing their own news servers they probably need to minimise the number of open-but-inactive connections.

>Sometimes, if post do make it to the server, they are available within
>minutes, almost making the conversation real time. There is something
>to be said about spontainous replys:). They loose their zest if you
>already have read it once:).

Strictly speaking, though, news isn't a real-time chat medium so you can't blame the server operators for not providing it as such. Maybe you need to try IRC for real-time conversations.

>Of course I could say I am using a 520ST and only have a floppy to
>save the file to.....:)

Ah. Kind of precludes offline reading, I admit. What about changing ISP to one which has its own news servers, with a longer timeout? It's about the only thing I can think of to get round the problem.

The Atari 8-bit works fine at higher speeds. With an 850 or an p:r: Connection interface you are limited to 9600 baud for reliable transfers, but with an R:Verter interface (very easy to build, a lot like an SIO2PC cable actually), you can realize 19.2kbaud reliably. Also there is the CSS Black Box which is the only interface I am aware of that provides transparent CTS/RTS (hardware) flow control. If you need help with your 8-bit, give me a holler in e-mail. I busted my ass rewriting my Carina BBS for 19.2kbaud and succeeded!

1770. MiNT, HSMODEM, and more questions!

Newsgroup: comp.sys.atari.st
Date: 1999-07-11 00:00:00 UTC
From: Technoid Mutant <Technoid@cheta.net>
Message-ID: <3788B5FB.C07472A3@cheta.net>
Source record: 76142

It has been a few weeks since my last foray into this newsgroup. I was trying to get Mint 1.4.1 running.

I have MiNT running very well now and have a ppp connection working as well. I am very happy with it but have quite a few questions I have not been able to resolve myself. First, I am running Mint 1.4.1 on an Mega ST4 (not ste) with no modifications on a color monitor. My interface is an ICD Link II using the drivers that came with the interface.

How do I get my CDROM drive running?

HSMODEM causes two bombs at boot if I load Mint. if not, it appears to load and work fine. I am interested in HSmodem because my 9600bps modem has v.42bis compression and I need 38.4kbps to use it fully. It works, but will drop chars and hang up after a little while receiving. At the moment I have the modem at 9600bps with speed buffering and compression disabled (at&q0&k0) which works but is not as fast as it could be. I have tried juggling the order of Mint.PRG and the two hsmodem prg files in my auto folder to no avail. No other auto programs are being used.

I got Gluestick running but don't quite know what to do with CAB yet. I am working on it.

How do I read/set the time on my mega st 4's real-time clock in MiNT?

ChronD causes a 'BUSS' error at startup. So far harmless but why? Is it not for old 68000?

The 'auto reboot' function at boot after a disk check causes a buss error - harmless.

WHO from the cli causes a 'BUSS error' and will not execute.

Date causes a 'buss error' and will not execute.

PPPD overwrites the console screen and scrambles GEM (AES 4.1). I have to change to low res and then back to medium to clear the gui.

Sometimes VI will go crazy and start typing chars to itself ruining my session. I open another virtual console and KILL the task and everything is fine again... no biggie.

BIGGIE - I am trying to update to Mintnet 1.03 and my machine generates a "virtual memory exhausted" when I 'MAKE ALL" or "MAKE INSTALL". How do I update to a later version of mintnet? I have disabled all virtual consoles in ttytab to gain ram which resolved an 'out of memory' compile error, but now I have this virtual memory error which has me stymied. Where is the virtual ram (swap)? Is it a file? How do I define it's

size?

Where is the configuration for mail and for news?

How do I upgrade my Mega ST4 to more than 4mb? Will MiNT recognize such an upgrade?

Thanks in advance

Technoid Mutant

as an alternative, I'd suggest reading the last two articles David Barkin
did in Atari Computing on how he interfaced his digital camera with his TT and
Hades: seems Microtek makes a SCSI-based PCMCIA card reader (many digital
cameras offer the option to store images from the camera with that card), and
David discovered that you could actually access the reader using HD Driver.

I agree, its a great program too. I used to use it also, for the
exact same purpose. I changed to TextView though, because I use
MiNT, and 1st Guide doesn't handle the long filenames correctly.

(at least my version doesn't)

See ya! ;-)

Nick, correct me if I'm wrong here-but doesn't the Mega STe have an
internal HD setup? In that case, doesn't it have to be disabled some
way before the external HD's will work? Just a thought.

(or why not just take the SCSI drive out of the case and install it
in the Mega STe's HD bay, thus doing away with another box and PS)

Later...

No, I don't think these are the same 2. Al Horton ran the Computer
Dungeon. Don't remember what the other guys name was. I still find
it hard to believe (knowing Al), that he didn't just donate the
whole lot to some group or individual. ;-(

1781. What's the best vector/bitmap drawing program?

Newsgroup: comp.sys.atari.st
Date: 1999-07-12 00:00:00 UTC
From: P&#65533;l Monstad <pmonstad@online.no>
Message-ID: <01becc7f$41ce3ae0$LocalHost@default>
Source record: 76003

I'm interested in both a good vector and a good bitmap drawing program for the Atari. The programs must run in => ST high resolution.

What can be recommended: Pixart, Artworx, Papilion, DAs Vector?? Don't think about price when you recommend. English versions preferred if available.

P&#65533;l Monstad

1783. Dead 520STfm

Newsgroup: comp.sys.atari.st
Date: 1999-07-12 00:00:00 UTC
From: HappyLad <happylad@nospam.net>
Message-ID: <7md6or$p9b$1@phys-ma.sol.co.uk>
Source record: 76005

A couple of days ago I found a 520stfm sitting on top of an empty PC and monitor box waiting for the bin men to collect.

Anyway, I took the machine home, plugged it and... Zilch, dead as a dodo. No LED's on the keyboard or other signs of life except for a knocking sound coming from within the case.

I've had the lid off and checked the power supply. When on open circuit (power connector disconnected from the mainboard) I get a steady 5v from the red cable and about 11v from the blue with no knocking sound. When I reconnect the power connector the measured voltages at the connector drop to about 0.3v and the transformer starts to knock.

I guess that there is a short somewhere, but where to begin?
I've disconnected the floppy and keyboard but the knocking from the transformer still persists so I assume that the problem is on the mainboard.
Any advice would be much appreciated.

->well. I am very happy with it but have quite a few questions I have not
->been able to resolve myself. First, I am running Mint 1.4.1 on an Mega
->ST4 (not ste) with no modifications on a color monitor. My interface is
->an ICD Link II using the drivers that came with the interface.

Get HDDriver, its much improved over the ICD stuff.

->How do I get my CDROM drive running?

You can use Spin!, or ExtenDOS Pro Gold from Anodyne software.

->HSMODEM causes two bombs at boot if I load Mint. if not, it appears to
->load and work fine. I am interested in HSmodem because my 9600bps modem
->has v.42bis compression and I need 38.4kbps to use it fully. It works,
->but will drop chars and hang up after a little while receiving. At the
->moment I have the modem at 9600bps with speed buffering and compression
->disabled (at&q0&k0) which works but is not as fast as it could be. I
->have tried juggling the order of Mint.PRG and the two hsmodem prg files
->in my auto folder to no avail. No other auto programs are being used.

The standard ST serial port is limited to 19.2k. Run DRVIN.PRG, then
the ST program (something like MFP.PRG, forget the name, but don't use
SCC.PRG, thats for TT/Falcons). Also, run these before MINTNP.PRG in
the Auto folder.

->I got Gluestick running but don't quite know what to do with CAB yet. I
->am working on it.

There is a MiNT specific OVL file for CAB. Use it, works better than
the GlueSTiK/STik for CAB OVL route.

->How do I read/set the time on my mega st 4's real-time clock in MiNT?

From the command prompt, type in "time". Well, type in "man time" and
you should get all the options. Hmm, note that I set my time\date from
XCONTROL and it works just fine.

->ChronD causes a 'BUSS' error at startup. So far harmless but why? Is
->it not for old 68000?

I'm not sure about his. There is a newer version of Cron that I'm using,
but my old version never caused Bus errors. Check the syntax in your RC
file in /etc. Mine looks like this:

```
# This is the old crond entry
#if [ -f /usr/etc/crond ]; then
# (cd /var/spool/cron; crond > /dev/null 2>&1 &)
# echo -n " crond"
#fi

# This is the new cron v3.0 entry
if [ -x /usr/sbin/cron ]; then
UNIXMODE="/brUs"; export UNIXMODE
(cd /var/cron && /usr/sbin/cron > /dev/null || echo "/etc/rc: cannot cd to /var/cron")
echo -n " cron"
fi
```

```
->The 'auto reboot' function at boot after a disk check causes a buss
->error - harmless.

->WHO from the cli causes a 'BUSS error' and will not execute.
->
->Date causes a 'buss error' and will not execute.
```

There are way too many bus errors there. Something is wrong,
but I'm not good enought to tell you what. Hopefully, some
of the more experienced MiNT users can help.

```
->PPPD overwrites the console screen and scrambles GEM (AES 4.1). I have
->to change to low res and then back to medium to clear the gui.
```

You need to use TOSWIN2.3 to send output to a console window. Until
you get it setup correctly, you can edit /etc/syslog.conf by putting
a # in front of lines that send output to /dev/console. (you do know
already to use a editor like QED (from TOS desktop) to insure that
you keep your Unix lf endings, right? Otherwise use VI from the
command line-read up on VI options before-so you don't feel lost,
its not a very friendly app) ;-)

```
->Sometimes VI will go crazy and start typing chars to itself ruining my
->session. I open another virtual console and KILL the task and
->everything is fine again... no biggie.
```

Don't know about this either. Sorry. Hmm, I see you are using the
AES that comes with MultiTOS, right? If you can find it, buy N.aes,
its a world of difference.

```
->BIGGIE - I am trying to update to Mintnet 1.03 and my machine generates
->a "virtual memory exhausted" when I 'MAKE ALL" or "MAKE INSTALL". How
->do I update to a later version of mintnet? I have disabled all virtual
->consoles in ttytab to gain ram which resolved an 'out of memory' compile
->error, but now I have this virtual memory error which has me stymied.
->Where is the virtual ram (swap)? Is it a file? How do I define it's
->size?
```

Can't help here either, sorry.

->Where is the configuration for mail and for news?

Ditto, I use aMail and Newsie.

->How do I upgrade my Mega ST4 to more than 4mb? Will MiNT recognize such
->an upgrade?

For the ST line, I -think- Woller sells a board, it uses TOS 2.06.

->Thanks in advance
->
->Technoid Mutant

You're welcome, and I hope I helped some. For some great info on
Unix, (and therefore MiNT), grab Unix Unleashed, its awesome! ;-)

Hi once more Ron,

funny, been playing with that as well the last few days.

Recall, I bought this Mega STe the other week? Which came with AHDI somuch, I got rid of that, installed Hushi on the 2nd drive (121 meg Conner) which did the job pretty OK. *Then* I couldn't get Hushi.sys installed onto the Seagate 48 meg drive that came with it.

I played some more today: removed the Seagate, put in the Conner, which got ID-0, and next the machine wouldn't boot from a HD. So I put back in the Seagate, managed to get Hushi.sys on the root and it booted fine from the Seagate... Next hooked up the Conner onto the ACSI port and this one goes along fine too...

So who's gonna tell me what's going on here?

The Seagate is a SCSI drive OK, internally it's on the built-in SCSI controller, using ID-0 and that one works fine. Next I connect the Conner to the ACSI port using a Link cable, no probs either. (And before someone starts yelling: this one has a Hushi.sys on the root too...)

Next I change the Seagate for the Conner and no more go...?

The Conner is terminated (3 packs), normally has ID-1 and is the only external drive on the chain. As a 2nd drive no prob, not as first/only drive. Not so on my ST, where it has been working for some years as the only HD without probs...

Well according to an article in the latest ST-Computer ii should work on
every Atari, even under plainTOS but to get the most out of it you need
to have a multitasking systeem (MagiC, N_AES), NVDI 5, HSMODA and WDIALOG.
Preferable is also an Atari with a serial port supporting 115.000 Baud.
The camera needs to have a serial port too as the connection between
camera and computer happens by means of the serial port.

Now the supporting: In the first place Olympus camera's (hence the name)
but according to an advertisement I saw in that German magazine the Nikon
Coolpix 900S and Epson PhotoPC 750Z are supported too.
Furtermore if one have a digital camera with a serial port which isn't
supported yet one can write to the programmer, Durs Locher. He will do his
best to adapt his program.
E-mail address of the programmer (Durs Locher)
durs.locher.1@sm-evtheol.unibe.ch

Such a function is coming in some form, but since very few applications
would ever use it, I do my best to automate these things instead.

In the Eclipse/mach64 driver, the AES background buffering (menus etc)
is already covered and that doesn't seem to cause problems for any
programs. I've also made it possible for screen->RAM blits of ordinary
applications to be done locally on the card, on the assumption that such
a blit will always be followed (soon) by one (might be extended in the
future) RAM->screen blit of the same area, and that the application
didn't really need access to the actual data.

I've not yet run into any application that actually uses the screen
data for any other purpose than to blit it back (except for the special
case of programs that write test pixels to the screen and then blit the
data back to figure out how to deal with a specific graphics mode (often
done by programs that can display images in true colour graphics modes),
but fVDI recognizes all variants I've run across of that and handles
them in another way), but two (plus the one we're talking about here,
it seems) 'reblits' the blitted area several times.

Naturally, none of this caching or memory allocation can be done if
there's not enough memory free on the card.

From: wanderer <wanderer99@free4all.co.uk>
Message-ID: <378A3B0F.MD-1.3.wanderer99@free4all.co.uk>
Source record: 76015

I've recently been given an Atari ST 520 but the mouse was broken.
Could someone give me the address of a shop/company that sells
replacements, preferably in the UK?

Cheers.

68k cheaper????

for a 68060/50Mhz (real 50Mhz, not double called like the 68040) you
pay $200. you can obtain a much cheaper version but without FPU and
MMU ....

You'll find a complete archive of AHDI 6.061 at:
http://bales.online.fr/atari/files

> Don't know how Atari uses its copyright on software
> years after vanishing from the computer market.

I've no idea what the official word from Atari ever was, but nowadays it
is generally considered that some things from Atari are freeware
(Xcontrol, AHDI, Chkdisk...) and some others are not (TOS, GDOS...)

I never have been able to clarify why we make such a distinction, or if
this was ever backed up by Atari.

Nope. The ST's serial port is stuck at 19.7Kbps, with or without
HSModem.

What HSModem DOES do, is that it speeds up TOS's serial port routines.
This does not give you a faster connection, but the routines take less
CPU time, giving you a more reliable connection. I think it also adds a
buffer and some extra stuff that is needed by some programs. It does
also allow TOS to use some hardware modifications that do speed up the
serial port.

So, contrary to common belief, HSModem DOES NOT speed up your serial
port on it's own. It DOES speed up the way TOS uses the ports. It CAN
use serial ports that are speeded up (sp?) by a hardware modification.

No it doesn't. As long as the hardware is stuck at 19.2Kbps HSModem
can't make it go any faster.

Don't forget, for HSModem on a Mega ST, you need just DRVIN.PRG and
MFP.PRG. DRVIN.PRG must always run before MFP.PRG. Not sure if MiNT
should run before or after those.

Next, the ST's serial ports are limited to 19200bps, with or without
HSModem. See the post above (or below) about HSModem. If you want to go
faster than this, you will need to perform a hardware modification on
the ST's motherboard.

With that speed you should be able to get a clean 14400Kbps connection.
I've no idea about old 9600bps modems.

<MiNT specific questions snipped>

>
> How do I upgrade my Mega ST4 to more than 4mb? Will MiNT recognize such
> an upgrade?

There is only one board that allows you to upgrade to 16Mb, it the
german Magnum board (from Woller I think ?). It requires TOS 2.06 and
is pretty expensive.

> 1040ST sees the HD without a problem, but the Mega refuses to recognize it.
> Where do I go from here?

Not sure. It should work the way it is.

When you say it doesn't see the hard drive, do you mean:
-AHDI doesn't find it or doesn't run at all when you bootup ? In this
case, there is some weird problem. Try running AHDI from a floppy to see
what happens.

or

-The icon doesn't appear on the desktop. This is just because the icon
must be installed manually, and even if the drive has been setup and is
running, you still have to add the icon to your desktop. The desktop.inf
file was changed to newdesk.inf with TOS 2.0x, so this explains why the
icon isn't saved.

That's all that came with it. There are no system disks, since the
system is in ROM.

Check out the Quick FAQ for general info if you're not too familiar with
the ST range. The STBook is basically a portable STE with a couple of
improvements.

> I also need a source for the mini midi to full size midi
> adapter.

Can't help you there. You might have to build one yourself if you have
the pinouts. Usually Atari put their pinouts in the manuals. Did it come
with a manual ?

Do you say, that the Chronos programmer now works for SGI?

Something like when 3D Studio was released from AutoDesk, it looks exactly like
Tom Hudsons CAD-3D, and indeed it was.

Come to think of it,- wasn`t there also a Phoenix 3D package? Or am I
mixing it all up here,- again!

cheers

I guess if fVDI had a function for allocating this memory on the GFX card
instead of using "system" memory this would be _very_ fast on a graphics card
as well. So maybe it's time for you to make this call availabl, Johan? Then
it's just a matter of checking the cookie for fVDI and then use a malloc
provided by fVDI instead and off we go. :-)

: > language disk).*
: That's all that came with it. There are no system disks, since the
: system is in ROM.

Hmmm... There is a language disk, and some useful STbook utilities out
there. I have two STbooks, manual, etc...

: > I also need a source for the mini midi to full size midi
: > adapter.
: Can't help you there. You might have to build one yourself if you have
: the pinouts. Usually Atari put their pinouts in the manuals. Did it come
: with a manual ?

The mini to standard MIDI cable can be ourchased through Best Electronics.

Cheers!

Anyone want to swap an English STbook rom for a German one?

I do have a homemade patch to make the keyboard behave like a US model,
but I would be so pleased for an English OS.

> > HSMODEM causes two bombs at boot if I load Mint.

This happens on my Stacy too and the hardware is similar.
Maybe there is a connection there?

> <MiNT specific questions snipped>

Never saw the original full post, though.... ;-/

> > How do I upgrade my Mega ST4 to more than 4mb? Will MiNT recognize such
> > an upgrade?

There have been a few boards, all of which require the TOS 2.06
upgrade to be recognized. MiNT handles whatever TOS throws at it.

1825. Positive Image 2 - available again at a new low price!

Newsgroup: comp.sys.atari.st
Date: 1999-07-12 00:00:00 UTC
From: stclub@cix.compulink.co.uk
Message-ID: <FErBzD.M6F@cix.compulink.co.uk>
Source record: 76084

FaST Club are pleased to announce that we have taken over the Floppyshop range of software and CDs. This includes the rights to Positive Image 2, a professional painting, retouching and image processing package that lets you work with 24-bit true colour graphics on any ST, TT or Falcon. All major file types are supported and you can print your work in monochrome or colour.

Positive Image has come about as a result of extensive research into professional photographic image retouching packages on non-Atari machines. The result is an image processing studio the likes of which had never before been seen running on Atari computers!

Positive Image is enhanced to take full advantage of the improved hardware on the STE, TT and Falcon, especially the DSP on the Falcon. Processor accelerators and graphics cards are used to their fullest capabilities. Positive Image is the only GEM-based image processing program that can edit 24-bit True Colour graphics on an ordinary ST in any resolution. Positive Image is packed with easy-to-use tools, these include: Brightness, Contrast, Stretch, Negate, Threshold, Histogram, Sharpen/Blur, Dodge/Burn, Eraser, Fill, Spraycan, Paint, Pencil, Rubber Stamp, Text, Rotate, Stereograms, and Filters that include Blur, Emboss, Erode and Vibrate.

This is the first Positive Image update in two years and we have concentrated our efforts on making Positive Image even faster, more intuitive to use. Around 30 new features and improvements to existing ones have been added, and we have vastly increased the number of graphic formats that can be loaded.

Positive Image 2, which was launched at £79, now costs just £24.95. Post free in the UK. Email for overseas postage rates and payment methods.

See next message for the full Positive Image 2 specification, or email for a copy.

Regards, Paul Glover

1827. Easy Text Pro - Atari DTP at a bargain price!

Newsgroup: comp.sys.atari.st
Date: 1999-07-12 00:00:00 UTC
From: stclub@cix.compulink.co.uk
Message-ID: <FErBzJ.M86@cix.compulink.co.uk>
Source record: 76086

FaST Club are delighted to announce the recent acquisition of the worldwide distribution rights to zzSoft's Easy Text Professional and Easy Text Pro Vector desktop publishing packages. Both versions of Easy Text are now included in the one package at just £19.95, which is less than you would expect to pay for a decent word processor, never mind a fully fledged DTP package. Easy Text is a major breakthrough in affordable Atari Desktop Publishing - it lets you create your own leaflets, brochures, greetings cards, posters, newsletters, business stationary (etc.) and gives clear, crisp professional quality output on all types of printer.

Easy Text Professional
Easy Text Professional can be run on a floppy based system (but is of course hard drive installable) and requires only 1 MB of RAM. It is a GDOS based package and comes with an installer program that completely automates the GDOS set-up. A selection of fonts is supplied with the package. All of the DTP features you would expect are there: lots of fonts and text effects, graphic file import, and drawing tools. Thousands of Atari users - from hobbyists to businesses - have used Easy Text for all of their publishing requirements. Easy Text Professional includes a 130-page fully illustrated printed manual and a simple-to-use installation program.

Easy Text Pro Vector
Easy Text Pro Vector is for those of you with more system resources to spare. It requires at least 2 MB of RAM and a hard drive is strongly recommended. You can work without a hard drive but you'll need to set up a RAM disk and have over 2 MB of free RAM, so a 4Mb machine is essential if you don't own a hard drive. You will also require SpeedoGDOS v4+, or NVDI v3+. The main advantage over Easy Text Pro is that the Vector version uses TrueType and Postscript Type 1 fonts for even more flexibility and higher quality output.

Price for both versions of Easy Text complete with a printed illustrated manual: £19.95. Upgrade: £12.95. Post free in the UK. Please email for overseas postage rates and payment methods.

stclub@cix.co.uk ~ http://www.cix.co.uk/~stclub

Positive Image 2 Specification
==========

System Compatibility
* Minimum requirement: 1 Meg of RAM.
* Supports all screen resolutions on the STE, TT and Falcon, including overscan, all virtual screen drivers and the various resolution boosters

such as Autoswitch Overscan and all known hardware and software resolution boosters on the Falcon 030.
* Compatible with MagiC Mac, Gemulator, and all releases of Atari TOS.
* Compliant with all 100% GEM compatible graphics cards.
* Supplied in two versions. The basic program runs on any Atari; the 68030 version runs on 68030/40 based TOS compatible system and uses the Falcon's DSP.

Multi-Tasking Features
* Fully compatible with Multi-TOS, Geneva and MagiC.
* Supports extended AES messages from Multi-TOS, WinX, Geneva and MagiC.
* Supports the Xacc protocol.
* Support for Multi-TOS and MagiC's drag and drop.

General Features
* Imports: AIM, Degas, Windows and OS/2 Bitmap, EZ-Art Pro, IFF (including Deluxe Paint ST, standard HAM, high res HAM, HAM6, HAM8, HAM12 and 24-bit HAM), IMG (including HyperPaint X-IMG and conventional X-IMG), InShape, Imagelab, JPEG, MTV Raytrace, NeoChrome, PC Paintbrush, Photochrome, Portable Network Graphic (PNG), Prism Paint, True Paint, Spectrum 512 (50hz and 60hz), TrueVision Targa, TIFF v6, and Tiny.
* Saves in most popular formats, including: TIFF, BMP, JPG, PNG, TGA, XIMG, EZA, P?1, and NEO.
* Full support for true 256-level Greyscales, fully preserving the colour depth.
* Comprehensive file information (filename, format, compression method, dimensions, memory required, memory free) is given when loading images.
* Handles conversions between monochrome, 16-colour, 256-colour, Greyscale and True Colour; performing colour quantisation or palette boosting.
* Colour selection compliant with RGB and CMY.
* Separate editing of red, green, blue and mask channels.
* All images are stored internally in 24-bit format and all operations are carried out on the 24-bit representation. This ensures that the same quality results are obtained whether pictures are edited in mono or True Colour.
* Uses tiling to redraw only the parts of an image that have been changed. This is in addition to having faster full screen redraws than any other Atari image-processing package that we have encountered!
* Near-instantaneous screen redraws in True Colour mode.
* Images can be intelligently rescaled and anti-aliased to suit the size of your paper. You can print out an image at up to 400% of its original size at 300dpi without any noticeable loss of quality.
* Windowed dialogues that may be moved to a more convenient location when work is being obscured.
* Multiple dialogues can be open at the same time and you can move between them freely, even under single-tasking TOS. Different tools can be active for different images and Positive Image always remembers the currently selected tool for the image.
* Includes a virtual memory feature which runs on any Atari with a hard drive. It's also compatible with TT Fast RAM and virtual memory drivers such as Outside.

* Supports multiple loading with Selectric and inserts the filemasks for supported formats into Selectric's mask list. These features also work with the Freedom file selector.
* Uses the Clipboard for cutting and pasting blocks.
* Retains multiple blocks in the Clipboard for easier montage creation.
* Support for Brainstorm's JPEG decoder.
* Standard GEM keyboard shortcuts for all menu options.
* Iconification of images to maximise desk space.
* Floating toolbar with short tool descriptions displayed as you hover over the icons.
* GDOS fonts may be unloaded when not in use.
* All the common text attributes: bold, italic, underline and outline.
* Powerful block handling features with eleven different overlay methods and user-definable transparency.
* Supports the creation of 3D stereograms.
* Sixteen zoom levels. Blocks, brushes, etc. are all scaled accordingly.

Falcon Specific Features
* 3D graphic interface.
* Compatible with accelerators.
* Fast DSP code handles most processor-intensive operations such as re-scaling, rotating, and dithering.
* Works on VGA and RGB monitors or a TV.
* Compatible with ScreenBlaster, BlowUp030, and other resolution enhancers.

Printer Support
* Prints from GDOS, SpeedoGDOS and NVDI.
* Includes its own printer drivers as an alternative to the various GDOS versions. These support all 9-pin and 24-pin Epson and IBM models (colour and mono), HP DeskJet (colour and mono), HP LaserJet, IBM ProPrinter, Epson Stylus (mono and colour), and Postscript printers.
* Supports half-toning, random dithering, clumped (the method used by newspapers) and Floyd-Steinberg.
* Images can be printed to disk. These files can be double-clicked on the desktop and sent to a printer. They can also be printed from a PC, Mac, etc.
* Can export images in PostScript format.

Image Processing Features
* All the usual tools such as Brightness/Contrast, Contrast Stretch, Negate, Threshold, Histogram, and Equalise are present, plus revolutionary new ones.
* Rotates to any angle to an accuracy of one degree.
* Real-time mirroring of images.
* Six built-in commonly used image processing filters: smooth, sharpen, remove noise, etc.
* Allows the user to create their own external filters for use with Positive Image. Includes a dozen useful pre-defined external filters: Blur, Emboss, Erode, Vibrate, etc.
* Supports 256 level (8-bit) masking with a configurable gradient tool to

aid mask creation.
* Processes user defined rectangular, circular, elliptical and bezier area definitions within Greyscale and True Colour images without affecting other areas of the image.
* Pixel precise area selection of any shape is supported by the use of Alpha Channel handling.
* Shearing and Warping (two different implementations) enable life-like twisting and distorting of images.

Image Retouching Features
As well as a powerful compliment of image processing tools, Positive Image includes a number of localised retouching tools with user definable brush size and shape. These are similar in concept to those found in any standard graphics package, but they have been enhanced to fully exploit the image processing capabilities of Positive Image.

* Sharpen/Blur - applies a local high pass sharpen (or blur) filter.
* Dodge/Burn - lightens or darkens each pixel in the area beneath the mouse.
* Eraser - erases any given area.
* Fill - as found in most graphics packages, but with user control over opacity, fade and strength.
* Spraycan - a traditional airbrush tool with the advantage that you can set opacity, fade and strength.
* Paint and Pencil - the standard painting tools. As with Fill you control the opacity, fade and strength of these tools.
* Rubber Stamp - a multi-purpose cloning tool.
* Full user configurability of all image processing tools.
* All retouching tools may be used in Positive Image's variable zoom mode to ensure pixel precise accuracy,

New in Version 2
A lot has changed since v1.12, most noticeably the increased speed of screen redraws and the vast array of new files that can now be imported. The new internal file structure speeds up block handling, screen redraws and graphic card support.

The 68000 (ST) and 68030 versions of Positive Image 2 are not identical in terms of features. Both packages offer significant speed gains over v1.12, but the 68030 version includes a number of extras which are not in the 68000 version.

New In Both Versions
* Improved graphic card support. We now have a universal graphic card driver which works on any graphic card.
* Printer type, printer port, paper size and monochrome dither method are now be saved as default.
* Screen tiling on colour displays is now twice as fast in 16-colour and 256-colour modes.
* Screen redraws on monochrome displays are now almost as fast as in colour.
* The increased speed of screen redraws has rendered the 256-colour dither

module redundant. This has reduced the memory overhead of Positive Image by 256K in 256-colour modes, leaving more RAM for loading images.
* Built-in printer drivers are up to 50% faster.
* Printing via NVDI is now supported.
* Colour printing is now possible with NVDI (v3 or later) and SpeedoGDOS (v5 or later).
* Positive Image 2 allows easy control over the setting of brightness, contrast, gamma and colour balance for the individual channels from within the Printer Setup menu. Different settings can be applied to different printers with different settings applied to different printer resolutions.
* Brightness, Contrast, Gamma and Colour Correction can also be adjusted when using SpeedoGDOS and NVDI, allowing you to tweak output to your own preference, just like you can with Positive Image's own printer drivers.

New in the 68030 Version
* New file formats: Art Director, Casio CV10/CV100, Genealogie Famille, Photoshow Pro, Photoshop, Photo CD, STOS Sprite Memory Banks, Studio Photo, TG1 coke, and ZZ Rough.
* Addresses the screen in native mode on MagiCMac.
* It is now possible to crop an image, quickly getting rid of any unwanted background.
* Zoom operations now work from the pixel in the centre of the displayed section of the image.
* New magnify tools allow you to zoom directly to targeted areas of the image.

If it is TOS x.06, the icon is not really needed, just press ALT+driveletter.
If everything is working, the desktop will open a window on that drive, otherwise
it will say: "drive x does not exist". This is the fastest way to see if the
harddisc driver is properly installed.

This is easily forgotten. I forget it myself sometimes. :-)

Henk.

Thanks for the info,I am very familiar with the Ataris having owned a 520stfm and a Falcon in the past(really wish I'd never sold the Falcon).I know the OS is in rom by system disk I meant something like a HD utilities disk,really I just wanted to establish what items came with the STbook.I'm very pleased to have it in my collection and am just thankful that no one locally realised how rare these things are and snapped it up before me.

Rob.

1833. Easy Stitch, Family Roots II and EZ Professional available again at new low prices

Newsgroup: comp.sys.atari.st
Date: 1999-07-12 00:00:00 UTC
From: stclub@cix.compulink.co.uk
Message-ID: <FErFI1.8Hz@cix.compulink.co.uk>
Source record: 76092

FaST Club have taken over from Floppyshop the distribution and support for Easy Stitch, Family Roots II and EZ Professional. These, along with the other Atari software and CDs published by Floppyshop, are available again at new low prices!

Easy Stitch
This is a cross stitch generator program. Cross stitching is the art of creating pictures and patterns by means of sewing coloured threads onto a fabric base. Easy Stitch is an adaptation of the traditional method of creating the cross stitch design on graph paper. With Easy Stitch, you can design your own patterns on screen in a way that is simply not possible using the traditional method. Blocks of the pattern may be selected for copying, rotating, reversing, enlarging or reducing, thus saving many long hours performing repetitive actions. Your grid may be any size up to a maximum of 1280x800 stitches, equivalent to a fabric size of 10 feet by 8 feet! What's more, you can move around it in seconds.

Easy Stitch allows pictures created by popular art packages such as EZ-Art Professional, Degas Elite, NeoChrome, Crack Art, Cyber Paint and so on, to be used as the basis for your pattern. In addition, the program allows for the use of the more complicated back stitches and half stitches, something lacking in many other cross stitch programs. Price: £9.95

Family Roots II
Family Roots is a program to assist anyone who is tracing their ancestry, or 'family tree'. Unlike similar products, Family Roots is not merely a customised database. It allows the user to link each individual into the family tree graphically on the work-screen, whilst allowing easy access to its integrated database where the data on each individual is stored. Genealogy is a subject that intrigues most of us and Family Roots II is the ideal choice for the professional genealogist whilst keeping it within the price range of the amateur.

Our popular custom written mouse-driven interface makes the program easy to use for the beginner, whilst giving access to more powerful features needed by experienced genealogists. Another unique feature of our software is that new entries can be added to any part of the tree - you do not have to define a starting point and work forwards - and all existing data is cross linked to take into account the new entries' relationship to everyone else in the tree. You can even start an unlinked tree on the workbench, which is separate from the main tree and link it in when you have completed your research and found out at exactly which point it fits

in. A powerful search function allows fast cross-referencing between individuals.

New Features in Family Roots II
* Family Roots II can now drive most 9-pin, 24-pin, Bubblejet, Deskjet and Laserjet printers.
* An illustrated printed manual has replaced the on-line manual.
* With a 520 ST you can store the details of 100,000 individuals on a double-sided disk!
* Loads data files from earlier versions of Family Roots.
* The grid display, status bar and menu can all be toggled on or off.
* The baptism date is shown if the date of birth has not been defined.
* The thickness of the horizontal and vertical lines is user definable.
* The text used for the short field names has changed to the professional abbreviations.
* The first letter of every name will automatically be capitalised.
* The vertical spacing between entries has been reduced to allow more entries to be printed per A4 page. You have the option to reduce it even further.
* Surnames and middle names are now viewable on the Brothers/Sisters/Children/Marriages database screens.
* The results of a search can now be sent to the printer as well as viewed on screen.
* All Preferences commands can be accessed using the mouse or a keyboard shortcut.
* The name of the most recent spouse is now shown on both the graphic workscreen and the print out.
* When saving your data file, the last version on disk is retained as a backup file.
* Horizontal scrolling now scrolls the work-bench by 25% rather than 12%.
* A page break is now sent to the printer after each database entry has been printed, rather than printing the entire family tree continuously.

Price: 9.95

EZ Art Professional
This art package was developed following a comprehensive study of the top graphics packages on the ST and Amiga. It appeared that the programs which were most desirable to the public were those which offered thousands of colours on screen. Due to the architecture of the ST, these types of packages were only ever seen on the Amiga.
They were great for creating realistic effects but would eat up huge amounts of RAM and were cumbersome to use. When developing EZ Art Professional, we decided to go 'back to basics'. The obsession with lots of colours had clouded everyones judgement to such an extent that they had come to think that you cannot create a realistic looking picture in 16-colours. This is a myth when you consider that the average game title screen and backgrounds are done in 16- or 32-colours. With this in mind, we have created a graphics package that is very easy to use, yet produces

realistic effects through the use of specially developed proprietary algorithms.
We have dispensed with the limited size of the low-resolution screen and given the user, perhaps the most comprehensive, yet simple to use, editing tools available on an ST. The program is icon driven and includes a built-in Help feature to guide the user as to the function of each and every icon. EZ Art Professional is exactly what the name suggests, it is EASY to use and can generate PROFESSIONAL results.

* Fully supports the STE's extended 4096-colour palette.
* Conversion between Atari, EZ Art and EGA palette modes. custom palettes for Sepias and Greys.
* Quantising and remapping are fully supported with loading and saving of palettes.
* Separate control of brightness so that you can make a colour a tone lighter or darker without having to fiddle with RGB sliders.
* Over 20 different types of shapes. These range from standard boxes and circles, to arcs, discs and shaded polygons. EZ-Art's range editor allows pseudo ray traced effects to create realistic looking 3D objects.
* Zoom-mode supports several different magnifications and smooth scrolling whilst in zoom mode. The zoom window shows where you are in the picture.
* Keyboard shortcuts for most commonly used functions.
* STE 'emulation' for STFM users!
* Interlace emulation lets you see what an interlaced picture looked like on an Amiga!
* 256-colour pseudo palette.
* Irregular blocks.
* 20 different effects may be applied to blocks. These include re-size, scale, remap, rotate, skew, shatter, soften, pixelate, and outline.
* EZ Art Professional has extensive font support. Fonts can be used at a wide variety point size with numerous text styling attributes.
* Fill Designer which allows you to load, save, grab and edit both mono (2-colour) and 16-colour fill patterns.
* Preview mode lets you view pictures that are larger than the standard screen size.
* Up to ten work-screens are available and they can be re-sized at any time.
* Over twenty drawing tools and modes. These range from the commonly used brush, line and point tools, to the less common but equally effective bezier curve, carve block, roller and tape measure. You can also measure lines and shapes as you draw them.
* File formats supported include: NeoChrome, Degas, Crack Art, Tiny, Spectrum 512, and IFF.
* EZ Art Professional comes with a comprehensive fully illustrated 60-page manual.
Price: £9.95

Prices include free shipping in the UK. Please email for overseas postage rates and payment methods.

FaST Club CD Collection

FaST Club CD#2
Imagecopy 4.1 with manual, Textstyle, Catalogued Clip Art Collection,
Greatest GIFs Clip Art Collection, GDOS and Font-GDOS, STC Calamus Font
Collection, Fontpac Plus GEM and Signum Fonts. Price: £29.95

FaST Club CD#3
The complete FaST Club PD and Shareware Library. 500MB of software and
files covering: Art, Applications, Comms, Clip Art, DTP, Education,
Entertainment, Fonts, Graphics, Information, Music, MIDI, Programming,
Utilities, Wordprocessing. Price: £19.95

FaST Club CD#4
Over 2000 Calamus and TrueType Fonts, STC Calamus Fonts, Fontpac Plus and
Signum Fonts. RRP £9.95

FaST Club CD#6
The Floppyshop Collection: Positive Image 2.0, Easy Text Pro and Pro
Vector, EZ Art, Family Roots II. Includes manuals; plus a collection of
fonts and clip art not already on any of our other CDs. Price: £34.95.

Floppyshop Gold CD Collection
Seven CDs containing every single disk from the Floppyshop ST and Falcon
PD & Shareware catalogues - 3900+ ST and 900+ Falcon disks!

Floppyshop Gold Volume 1
Utility, Word Processing and Programming disks, plus the Floppyshop
Compilation Disks.

Floppyshop Gold Volume 2
Art, Graphics and Font disks.

Floppyshop Gold Volume 3
Games, Midi, Music, Educational and Comms.

Floppyshop Gold Volume 4
Clip Art, Sound Files, Product Demos, Pictures, Astrology, Disk Magazines,
and the Your Second Manual support disks.

Floppyshop Gold Volume 5
Demos. (Directories are retained using archives that can be restored to a
floppy disk, or run off the CD by emulators.)

Floppyshop Gold Volume 6
Falcon collection, part 1: Art & Graphics, Communications, Education,

Fonts, Music, Product Demos, Programming, Sound Files.

Floppyshop Gold Volume 7
Part two of the Falcon collection: Clip Art, Entertainment, Demos, Games and Pictures.

Floppyshop Select CD
An anglicised version of a Falcon-only compilation from Michel Goux and Thierry Benet, who run the Azimut bulletin board in France. Select CD includes all of the top demos, audio programs, games, graphic programs, file viewers, lots of source code, multimedia packages, direct-to-disk recording software, disk magazines, masses of utilities, technical info, DIY electronics projects, and an easy to install Unix environment for your Falcon. With a few exceptions, everything is uncompressed and ready to run from the CD.

Floppyshop DTP+
Everything you need to enhance your Desktop Publishing and computer graphics set-up: fonts, clip art, support programs, printer drivers, printer utilities, word processors, image processing packages, and vector graphics packages. Everything is uncompressed and ready to run, so there's no time wasted de-archiving. Exclusives on this CD: 1200 Calamus fonts - including the commercial Oxieware and Bournemouth CFN collections, over 8,000 categorised clip art images - including complete collections by Stan Otterburn and John Weller, a special collection of over 500 photographs by professional photographer Nigel Scott, the registered version of Xlator, a German to English translation program, plus an exclusive release of the full version of the Edith Professional text editor.

Each CD comes with a catalogue that details every program on every disk, and wherever possible files are uncompressed so that the programs can be run from the CD. You don't have to have a CD ROM on your Atari to use any of the CDs on this page as they can be read on any computer (PC, Apple, etc.) and the files can be copied onto Atari formatted disks. It's easy, and we supply the instructions for doing this.

The Floppyshop Gold 1-7, DTP+ and Select CDs originally sold at £25 and are now amazing value at just £12.95 each.

Getting your Atari software on CD offers stunning savings on the cost of buying on 3.5" floppy disks; we can fit over 800 DSDD disks onto a CD! You don't have to have a CD ROM on your Atari to take advantage of these offers as the CDs can be read on any computer with a CD drive (PC, Apple, etc.) and the files can then be copied onto Atari formatted disks. It's easy, and we supply the instructions for doing this.

Most of our software is now available on CD - see the back page - and we now have PD and Shareware Libraries from Floppyshop and the FaST Club available on CD. That's over 5000 floppy disks of great Atari software!

Prices include free shipping in the UK. Please email for overseas postage
rates and payment methods.

news:7m5t34$995$1@SOLAIR2.EUnet.yu...

> A good point, but it need not be so, if an emulator is properly made-
> in which case it perhaps stops being an emulator and becomes an
alternative
> OS.

Once you have a "native" OS on your computer, all emulation will be
second rate
compared to it. Let's face it: Nothing gets better from using an
emulator.
Alternative OS:es is no small thing to construct. Big organizations with
lots of resources (IBM,Sun,Linux, SCO Unix, BEos etc etc) come out with
good OS:es, but these are often cramped, no support for much of the
hardware, meager third part software offerings, and usually no games.

It appears that there are three factors which make up for Windows
success:
*Support for mostly all hardware available.
*Enormous supply of games.
*Programs for every possible use.

Microsoft/Intel have also shown that it's not much point in slimming
down software and hardware. Press the gas pedal to the bottom and never
look back. What matters to most people is more colors, more sound and
bigger screens. So that they can watch those porno flicks in sixteen
million colors and hear the groans of the actors in stereo...

The conclusion is that a new can OS only break thru if it somehow
enhances the consumption of pornography. I vote for 3D projections in
the air (over the bed) and possibly dream machines, hardware and
software that senses where you are in the sleeping cycle and then
activates routines which influencew your dreams. Successful experiments
have been made for the purpose of improvements in learning. But my guess
is that this will instead be used for... (can you guess?) ...hi-tech wet
dreams. Of course. When our masters realize the potential of this
technology, they'll probably monopolize it for themselves... So that we
all think the same, passive, way which will ensure their grip on power
for ever and ever, in aeternum...

> Really? Do you know what of QNX is on that CD? A computer magazine
here
> made a similar announcement for a CD they published last year, and it
turned
> out that they put the QNX demo from QNX web site on the disk.

Yes, it's the demo in CHIP Magazine as well. There is one version for modem and another for network use. The game Hanoi Towers is included.

> My pun was aimed at the extremists who swear they will never use anything
> but a "real" Atari hardware.

Hmm, fanatics. Atari has never been isolated from the rest of the computer world. The first Atari was an emulation on a Vax computer, so there we are again...

> I made and
> installed such a unit with a 12MHz MC68881 into my Mega ST,
> and it speeds some programs by anything between 400% and 1600%.

I always wondered about that FPU thing. What programs are sped up?

Hi - I have just brought an Atari 520ST...

I am hoping to buy the following games:

INDIANA JONES AND THE TEMPLE OF DOOM
DIZZY COLLECTION
DIZZY'S EXCELLENT ADVENTURES
WIZBALL
THUNDERCATS
BUGGYBOY
WHERE TIME STOOD STILL
SPACE HARRIER
TOTAL RECALL
ROBOCOP
PUB TRIVIA
SWITCHBLADE
TURRICAN 2
ESWAT

If anyone would sell me these games (reasonable prices please) - please
e-mail me..

Gordy,

I'll bet that your solution to Bob Kings problem, won't work. Something is wrong with the latest version or MagiCmac. I posted this same exact problem months ago and one of the programmers(Sasa), even sent me a different RSC file and it didn't work. The only solution is to use a 3rd party DeskTop program like Ease or Jienna.

Hi All,

My good old Trust 14,400 modem has died and so I need to replace it.
I am considering buying a 56K modem but when I last looked at 56K
modems there were two different technologies available, both
incompatible with the other.

So, how many Atarians out there use 56K modems and which one(s)
would you recommend?

Thanks.

Regards,

Ben Hills.

BK MANUAL 1040ST original either 86 or 87, good condition $ 3

BK MANUAL PTC1426 for the color TT 14" monitor, bit warped $ 3

BK MANUAL TT/ST RAM Expansion Board Manual - install instructions $ 3

BK MANUAL TT030 manual near mint condition original TT manuals $ 5

BK MANUAL TTM195 for the 19" mono TT monitor, multilanguage $ 3

BK MICHTRON BBS v3.0 $ 1

BK SPACEQUEST 3 Hint book $ 2

BK SPEEDO GDOS full version manual/users guide, beautiful mint condition, $ 2
in English and French

BK THIRD Book of Atari ST Topics by Ralph Turner, the series continues $ 2

CABLE 25PIN Modem/serial/printer cable 25 male to 25 male Dsub approx 5' $ 3

CD-ROM SCSI 1X Chinon CDS-435 was working fine but now just ejects disks $ 9
when inserted, has recent ROM upgrade

FLOPPY 3.5" Atari external floppy drive; flakey - reads ok sometimes but $ 16
most of the time doesn't; perhaps fixable; sold as-is, incl working power
supply and floppy port cable

FLOPPY 3.5" Oceanic America Master-3S external floppy drive, incl floppy $ 34
cable and power supply

FLOPPY Atari external floppy drive $ 25

FLOPPY DISKS quantity 10 DSDD namebrand 720k disks pre-used, no guarantee $ 1
but should work fine

FLOPPY DISKS quantity 20 DSDD noname 720k disks pre-used, no guarantee $ 1
but should work fine

FLOPPY DISKS quantity 7 DSHD noname 1.44M disks pre-used, no guarantee $ 1
but should work fine

JAGUAR/STUG T-SHIRTS gorgeous black XLG Fruit-of-the-Loom T-shirts with $ 9
our Atari club's logo on the front and on the back "Jaguar" in huge red
lettering (like on the Jag box) with eerie yellow eyes above it and "64-bit
interactive multimedia system" written below, Brand new never worn leftovers
from a show we attended

JOYSTICK Epyx 500XJ joystick - minorly broken, probably fixable or usable $ 1
for parts

JOYSTICK Epyx hand conformed joystick $ 3

JOYSTICK sold as set: 2 Wico hand-formed joysticks, 1 in perfect $ 2
condition, 1 sticks a little

MAGAZINES great deal! 13 Atari mags, 1 Atari disk all together in one $ 2
super cheap set! email for titles, shipping not included

MEGA STe computer 16Mhz 4MB RAM, 300MB+ internal hard drive, HUGE PRICE $269
REDUCTION - was $425! everything works, Great computer with BIG hard drive

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem $ 10
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume $ 10
control, great starter modem for older computers, incl phone cable, serial
cable add $5

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem $ 8
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 2400 baud GVC, AC adapter, great starter modem for older $ 17
computers, incl phone cable, serial cable add $5

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't stay pushed in unless you hold it; fix or replace with a switch from Radio Shack; otherwise works perfect with great picture $ 18

MONITOR color Atari SC1224 working $ 33

MONITOR color Atari various models working $ 33

MONITOR mono Atari various models working $ 30

MOUSE Golden Image optical mouse, no ball, super light, amazing mouse! minorly broken, button sometimes works and sometimes doesn't, and it often doesn't want to move right; comes with special gridded mouse pad $ 1

MOUSE PAD by Moustrak Inc, grey $ 1

MOUSE original Atari mouse guaranteed working $ 11

POWER SUPPLY external for 520 ST's $ 17

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best with larger dot matrix printers, sturdy smokey-clear plastic $ 4

PRINTER SWITCHBOX Pengo 25-pin for modems or printers $ 10

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI cables $539

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with ROMS (disk/docs/cable) $ 28

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your clock automatically every time you boot. Incl box, software and hardware. Suggested retail was $57.95. Brand new. No guarentee on lithium battery (estimated 10 year lifespan) $ 17

SW ADVANCED Art Studio paint program from Rainbird (disk) $ 2

SW AEGIS Animator animation generator and viewer (disk) $ 2

SW ASSEMPRO assembly language compiler (disk/docs) $ 2

SW BALANCE Of Power strategy game; manual needed (disk) $ 2

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 5

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 2

SW CRACK'ED game published by Atari (disk) $ 2

SW CYBER Studio Set - hundreds of dollars of great CAD/paint/render software! cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02, cad-3d, plotter & drivers, human design disk, cartoon design disk, cyber control (disk) $ 19

SW DAC Easy Accounting software 2disk (disk) $ 2

SW DEGAS Elite - brand new! original disk envelope is unopened! $ 8
(disk/docs)

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 2

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below $ 26
(disk/docs)

SW DUNGEON MASTER includes Secrets of Dungeon Mastery book, considered by $ 2
some to be the best ST RPG game ever! (disk/docs)

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms $ 2
and pathology recognition (disk)

SW EZCALC good spreadsheet (disk/docs) $ 2

SW FLEETSTREET PUBLISHER v1.0 3 disk set, top notch DTP program (disk) $ 2

SW FSM GDOS 5 disks (disk) $ 2

SW GDOS original Atari version 2 disks (disk) $ 2

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as $ 2
an ACC or PRG, works with all word processors (disk/docs)

SW IMAGE CAT complete graphics cataloging system for all Atari ST $ 2
computers (disk/docs)

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black $ 1
plastic videotape style box with the company logo all over; slides into a
white Interlink box

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun $ 3
w/pixelated nudity by Sierra (disk/docs/box)

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 4

SW LEXICOR Chronos keyframe animator tt030 v1.3 amazing animator for TT $ 14
(disk)

SW LEXICOR Chronos keyframe animator v1.3 3disks amazing animator (disk) $ 14

SW LEXICOR Prism Paint v1.5b 4disks, top notch paint program (disk) $ 10

SW LEXICOR Prism render TT030 v1.03 top notch rendering program (disk) $ 12

SW LEXICOR all 4 Lexicor software packages together, great deal! (disk) $ 23

SW LIVRE Du Graphisme (disk) $ 2

SW M1 TANK PLATOON still the best tank sim out there, all original $ 7
manuals (heavy Microprose kind:) and box included, includes PC/DOS version too
(will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working
backup) (disk/docs)

SW MACRO Mouse by Antic, record mouse actions (disk) $ 2

SW MARBLE MADNESS from the arcade version, great fun! (disk/docs) $ 2

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, $ 6
manual for Mergeit only (disk)

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable $ 2
(disk)

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need $ 1
a manual for copy protection (disk)

SW OMEGA strategy game by Origi (disk) $ 1

SW OSS Personal Pascal v1.02 (disk/docs) $ 3

SW OSS Personal Pascal v2 (disk/docs) $ 8

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual $ 1
for copy protection (disk)

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 2
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 2

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW SPEEDO starter kit, incl SpeedoGDOS and 20 bitstream Speedo outline $ 8
fonts & 5 disks of fonts from Toad computers; 9 disks in all! (disk/docs)

SW STALKER 2 older version probably upgradable (disk/docs) $ 3

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 18

SW STENO 1 older version probably upgradable (disk/docs) $ 3

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 9

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 6
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 2
great car racing game with 2 bonus packs of cars! 4 disks (disk)

SW TEST DRIVE by accolade (disk/docs) $ 4

SW UIS Universal item selector v1.0 the best file selector replacement $ 1
(disk)

SW UMS Universal Military Sim, looks great especially in mono $ 2
(disk/docs/box)

SW UVK Ultimate Virus Killer (disk) $ 9

SW WARP9 speed up the graphics on all TOS machines lots! (disk/docs) $ 12

SW WORD For Word crossword puzzle creator (disk/docs) $ 2

SW WORDFLAIR v 1.1 the integrated document processor (disk/docs) $ 10

SW WORDWRITER ST a fast easy to use word processing system from Timeworks $ 3
that can interface with their Spreadsheet & DB (disk/docs/box)

SW WORDWRITER ST by Timeworks great graphical wordprocessor (disk) $ 2

SW WORLD GAMES by Epyx challenge yourself or a friend in different $ 2
events! (disk/docs)

SW Z-RAM Diagnostics v1.1 for use with Z-Ram RAM upgrades (disk) $ 1

SYQUEST 44MB removeable hard drive w/1 cartridge in 2-bay (1 bay free) $ 69
"shoe box" style external case incl host adapter so you can hook this drive
directly up to any ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive. Incl DMA cable
and software. Everything you need to get going!

SYQUEST CART 44MB each in quantity of 3, no bad secs $ 19

SYQUEST CART 44MB no bad secs $ 29

SYQUEST CART 88MB no bad secs $ 33

SYQUEST CART 88MB quantity of 5, no bad secs except 1 cart $113

GOLF VIDEO VHS Improve Your Golf Game w/Richard Zokol, new shrinkwrapped $ 1

DAISYWHEEL PRINTER DaisyWriter 1500/2000 wide carriage, includes good $ 19
ribbon, has weird interface connector, seems to work but sold as-is

FLOPPY DRIVE 5.25" probably dead $ 1

FLOPPY DRIVE 5.25" tested, working $ 3

SIMMS 1MB 30pin, quantity 4 sold together $ 6

ATARI JAGUAR game Checkered Flag (racing) incl FREE shipping $ 11

ATARI JAGUAR game Iron Soldier (3D robot 1st person shootemup) incl FREE $ 12
shipping

ATARI JAGUAR video game console system mint condition, less than 1 year $ 53
old, lightly used, incl original boxes/manuals, A/C adapter, TV conv, 1
controller, with all 3 games

Hmmm, it's a long time since I did that kind of programming -- but I
thought that vro_xxx needs the same number planes for both source and
destination...

The first thing to check is how the MFDB for the screen is filled. It
is wrong to use XBIOS to find any values here -- just set the screen
address to 0 and let VDI worry about the rest..

Actually this disctinction was made by Atari. I don't think that
anything has changed since (how could it?)...

Not quite sure, as I've never actually owned a Mega STE. You might be
right. He didn't mention having an internal drive though.

> (or why not just take the SCSI drive out of the case and install it

Version 2 and 3 will both work on an STE. I've never actually seen
version 1.

Very interesting, just the kind of vertical app that can end up being
very useful.

>would you recommend?

Hi Ben,

I use the external K56/V90 modem that System Solutions supplied. Unfortunately, it does not have a manufacturer's name on it - just "Made in Taiwan". All I can tel l you is that it came in a box about 9inches x 12inches, with "High Speed Fax Modem" on the front and the border of the box has approval marks from loads of different countries.

I recently saw one of these on sale in my local John Lewis' department store for UK69-00. I use it on the Zetnet digital lines and I'm very pleased with the performance.

If you want any more details mail me direct and I 'll try and describe it more fully.

Cheers

Paul

Try Titan or Systems Solutions. Both have a web site that you should
easily be able to find.

> impressive!

Well, I dunno.. It would be nice to have a dedicated Linux machine,
although the PC is close to it already (since the 386 was designed to
run a Unix variant in the first place). But the big advantage of the PC
is of course the "inflation" induced by Microsoft: Systems that are
pretty powerful are worthless for running m$ bloatware so they cost
virtually nothing, which makes the PC a very cheap and relatively (to
it's price) powerful Linux box, I wonder if the new Amiga can be more
interesting in that aspect, even though of course the basic design of
PCs is complete crap. :)

Maurits.

1855. [HELP] PC-Speed installation leaflet

Newsgroup: comp.sys.atari.st
Date: 1999-07-13 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <7mf0rp$e7j$1@nnrp1.deja.com>
Source record: 76029

Hi,

Many years ago, I acquired a "PC-Speed" device which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

1857. Calligrapher Pro on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-07-13 00:00:00 UTC
From: BobKing <robert.king@patent.gov.uk>
Message-ID: <378B0872.1B51B528@patent.gov.uk>
Source record: 76031

I have Calligrapher Pro. (second-hand) and have followed the installation procedure, but always end with a repeated message to insert a disk. I think I read somewhere that the first time you install Call. on a HD, it modifies the main floppy and you have to have this floppy in drive at all times. Is this it and if so is there any way round it? I normally use Papyrus or Protext, but the 'Outline' and Maths tools look very interesting.

Bob_King

1858. Install icon with Magic 6

Newsgroup: comp.sys.atari.st
Date: 1999-07-13 00:00:00 UTC
From: BobKing <robert.king@patent.gov.uk>
Message-ID: <378B0D0A.5CE6644E@patent.gov.uk>
Source record: 76032

I seem to have forgotten how to allocate an icon to a program or file in Magic 6 and Magixdesk. I managed to do it or CAB, but how I can't remember. Clicking on install application brings up the menu, but not the layers of icon windows produced in earlier versions of Magic. Clicking on install icon produces nothing. Is it something to do with the new mod_app.ttp, which seems to be called internally, since drag/drop a file on it gives an error giving the correct syntax. The manuals have got progressively thinner, at least in the first one you got a programmers appendix.

Bob_King

Erm, select any drive icon, go to Options > Install Disk Drive, Call it
"C" and "Hard Disk" (or whatever), and Install.

Then, Options>Save desktop.

> would you recommend?

Yes. Both of the (old) standards will gradually be replaced by the v90 standard so, in truth, it would be better to go for one of these. Having said that, though, many of the old-standard modems are capable of flash-ROM upgrade to v90 so you could go for one of these and widen your choice.

UK phone lines seem to support 42K or 44K, ATM. You would be very lucky to get a 56K CONNECT. However, as the only other choice (but dead cheap) is a 33K6 modem it is worth paying for the extra bandwidth especially if you do much /www work.

>

Never mind.
I never threw my old ST away, cause still working fine.

I imagine the following:
Remove VDI that nobody uses from TOS 2.06, perhaps then it fits in 192 Kb.
My TTdigger can produce a assembler file from the ROM's. (One must have these
of course)
Reassemble for use at $FC0000 and flash.

If one has paid for Magic, one could do the same with MAGIC.RAM.
Just a thought.

If you succeed, your work could be a starting point for a soldering wizzard that
owns a TT, I think there are lot of those. (I am not. :-)

Henk.

Remember your idea of porting MintNet to MagiC ? Well, most of it has
been done, including the tools, library and examples. Tools and lib
are even binary compatible to Mint (Pure C), MagiC drivers are not ;-)
I still need to make the xifs (full dd support and signals are two
points that MagiC has severe limitations compared to MiNT) but I think
I've found a workaround. With MagiC > v6.1 where user/group ids etc
are (at last) supported, things will be easier. Note that as it is now
(and using the internal driver) it does more than 200k/sec with a
simple TCP client/server (MagiC 5.11, TT 4+4).

I'm sure now you understand why I was so happy for the translations ;-)
Life is becoming easier for me from now on!

If you're using STinG's dialer you could try to 'ping' the news server
while you're working. This will keep them busy ;-) In fact STinG's
ping utility is very fast in sending packets, but since ping source
is included in STinG's archive, you can write your own (to ping for
examle every 10 seconds).

Could be that your Conner has parity enabled?
In that case the internal controller of the Mega STE can't "talk" to it.

The Link, being newer and better, has probably parity handling enabled.

You can add a parity chip to the Mega STE SCSI controller. I described
one solution a couple of years ago, you may find it on the net.

Take off all the casing and use a vaccum cleaner to suck out all the
dust and possibly loose pieces of cable, scews etc. Also inspect the
board for spilt coffe, Coca~Cola, ketchup etc. Press down all socketed
chips. Also try starting the computer without the metal shielding, since
this sometimes causes the shorts.

Click on Assign Icon from the options menu.Two windows should open up
one with the icons and the other with the files.Select the icon you
need and drag it onto the file in the other window and click on
ok.Sometimes you may have to reprosition the icon window as it can
get covered up by the other window.

Ta for your help. What you advocate is exactly what I did with earlier versions of Magic, see my references to 'layers of icon windows'. With 6, a click on Assign Icon very rarely produces anything. As far as I can see, the MOD_APP.TTP file, (does this change the strange APPLICAT.APP/DAT files) first appeared in version 6, so something has changed. Please don't flame me if I'm wrong, as I'm writing from memory, in front of my office PC. I want to keep 6, the earlier versions were too unstable, espec. with my use of OUTSIDE. If all else fails I'll do without fancy icons on the desk top. Why have such a complicated desktop defining setup? At least with TOS you can hard-wire NEWDESK.INF!!I'll try your advice again tonight, perhaps this time!!

And what the hell is happening to the space between Bob and King???

Re your complaint in your signature, perhaps all your expansion slots were occupied!

Bob(with a space)King.

It also removes the RTS/CTS bug in TOS - which is perhaps its most
important function!, And of course there are special programs for Megas,
TTs and Falcons whose ports allow faster speeds than 19k2; as Atari
omitted these higher speeds in the serial.cpx, these HSMODEM programs
re-map some of the useless very low speed 'labels' to give higher
speeds. It's all in the HSMODEM docs!

>

What's the interface for? If it's a general I/O interface, can I suggest playing about with the enhanced joystick ports (EJPs) instead.

I haven't verified this experimentally (it's on my list of things to do one day), but the way you access joypads through these implies that between the two ports there are three 8-bit bidirectional I/O ports. It might "just" be a single output port, and two input ports though: I'd need to look into this a bit more to verify which. Of course, in addition to these, there are two 8-bit A-to-D converters as well. There should be enough interface options there for most people ;)

For more information in general, there a FAQ at my website, which is long overdue an update (also on the list of things to do), and my series of articles in AC (those on the joypad hardware and software will be most appropriate).

Cheers,

Xav

The gizmo has a positive and negative rail that's all. 2. Anyone know where I can get a new STe case in uk (I mangled the last one installing the gizmo)
>

A looong overdue reply, but here goes:-

1) Only 5V AFAIK
1b) Pin 9 for GND and 7 for +ve.

As the MIDI Gizmo (what is this, BTW) is installed internally, there are plenty of better/easier places to tap off the power from the motherboard itself. Just don't ask me to name them ;)

Aixit, who did have a web site www.aixit.com IIRC.

I have a 14Mb board in my Lighthouse tower'd ST, one also needs either MagiC
OR TOS2.06 to use it.

I should imagine that the board would be a tight fit inside a standard ST's
case.

Take a look at Magxdesk's applicat.inf file to make sure the x and y coordinates of WINDOW ICONS haven't gone awry. If they have, the window containing the icons might be placed off to the side of your screen, as if it's not there. You'll know this is the problem if you see excessively high values for the coordinates, which are based on your screen size.

Nach langer ï¿½berlegung entschliese ich mich meinen Atari doch mal anzubieten
und zu Verkaufen.

MODEL 1024 STE:

-
7 Jahre alt davon 2 Jahre benutzt.
Tos 2.06,4MB Arbeitsspeicher, Extern HD Laufwerk u. SW Monitor original
Dos Emulator 286. Hardware.,Programme und Treiber
SCSI Festplatten in externe Metall Box 70MB + 120 MB Stck.
also einfach alles was ich von diesem Teil ATARI habe.
Wer also so ein Model sucht sollte vorbei kommen es lohnt sich fï¿½r dich.
Preis VHB bitte per Mail antworten.

PS: Rechnungen alle vorhanden.
der NP: betrug damals ca 3800,- DM

subject of Cartridge and Portfolio card?.
>Hello.
>
>What about reading, writing directly from a Portfolio card?
>Is it possible to make?
>

There is a piece of hardware that allows the PC to read the cards, it
would be nice to use it on an Atari.

The PC card requires a free ISA slot and the software runs in DOS:(

Is this the best way to fix the RTS/CTS flow control bug? I've used turbocts in the past, and now I am using xcontrol with the serialfx.cpx combined with serfx20.prg in the AUTO folder (the three need each other).. but they clog a lot of memory which I can use for other programs on 1 meg ST running BBS software.

Would I be able to run hsmodem without xcontrol and use less memory and still fix the flow control problem?

This has happened to me when the icon window has totally
disappeared.The window is there but its off the screen so you think
it has failed to come up.On a personnal note,I would not use Magxdesk
as I find it very limited compared to Jinnee or Thing.I am using
Jinnee and find it a whole lot better than Magxdesk.

> http://www.it.lth.se/~sven/Fenix\index.html

I did. Quite interesting stuff, and on lines similar to my thoughts.
I have some little doubts, though. The system is developed for the
(abandoned??) 68K family with ports to other processors envisaged only in
the future. PPC is fine, but for success I think it must be ported to the
widely spead Intel family also. And it looks a bit like inventing the wheel
again- because miniature kernels of Unixoid OS-es already exist- besides the
mentioned QNX I've heard there are some other similar solutions, already
proven.

>And a well written emulator on a modern system can be faster than anything
>using real 68k hardware.

Here's a little comparison of relative performances of PaCifiST 0.48,
TOSBox 1.08, Gemulator 98, and my Mega ST with 12MHz FPU, as I have
measured them by Gembench, referred to a ST with a blitter (Mega ST, that
is). Even if one has reservations towards the validity of these tests,
especially towards the way Gembench computes an "average" speed, it is
still informative:

Ref: ST + Blitter, ST High
Tested on a 166 MHz Pentium

TOS 2.06 AES v3.20 GEMDOS v0.32
MiNT not present Blitter Enabled NVDI not present
Video Mode: 640*400*2
FPU not present Run and Malloc from STRAM

Gemulator PaCifiST TOSBox MegaST+FPU
==
GEM Dialog Box: 390% 683% 514% 268%
VDI Text: 139% 238% 166% 99%
VDI Text Effects: 166% 226% 150% 97%
VDI Small Text: 186% 238% 169% 98%
VDI Graphics: 249% 315% 215% 96%
GEM Window: 137% 269% 250% 99%
Integer Division: 2769% 2236% 1791% 99%
Float Math: 453% 358% 273% 1635%
RAM Access: 1285% 445% 560% 99%

ROM Access: 1340% 407% 484% 99%
Blitting: 136% 265% 762% 98%
VDI Scroll: 139% 262% 224% 100%
Justified Text: 105% 255% 186% 98%
VDI Enquire: 698% 314% 225% 99%
New Dialogs: 323% 527% 357% 165%
==========
Graphics: 242% 326% 292% 119%
CPU: 1461% 861% 777% 483%
Average: 567% 469% 421% 216%

It can be seen that different emulators excell in different tasks,
but, as I have said, my (subjective) impression of overall speed
is similar for all three of them.

I do not pretend that I have made an ideal setup for any of these
emulators, so maybe some of them is capable of faster speeds.

>>That's true, but when some essential utilities like the LZH shell, or a
>>classic program like Megapaint do not work (they both have problems
>>with file-selectors under PaCifiST), it is a bit too much.
>
>Problems with file selectors? That's strange.

I must correct myself: with PaCifiST 0.48 Megapaint now works ok! LZH Shell
still does not show any files from the opened archive in its archive-
contents window.

Hi Keith,

I'm not so sure there is a way at this time, being that it's a USB. I, myself decided to buy a Beige G3 mine tower without the USB port, because I needed the SCSI and video ports.

I thought there is a way to print out of MagicMac using NVDI. And that there is a Calamus SL98 driver for NVDI... if so, isn't it just a matter for the NVDI people to write a USB driver?

Also, do you still have a SLM804? Supposively there is a program out that allows you to output from the MAC over a null modem cable connected to an Atari with a SLM hooked to it. I think it's called MAGICSLM.ACC I tried it and it crashes all my Atari's. I think I'll re download it, something may have gotten screwed up. So I haven't actually connected anything yet, and I still need to get a null modem cable for the G3.

A quite noticeable touch of sarcasm and bitterness in your recent messages.
Any particular reason for this, except the world around us? ;>

>>turned out that they put the QNX demo from QNX web site on the disk.
>
>Yes, it's the demo in CHIP Magazine as well.

So not really useful for anything :(

I have access to a machine that seems to have almost everything of the
QNX installed (including Photon, Application builder, etc.) EXCEPT a C++
compiler- so I can't experiment with programming anything :(

>> I made and
>> installed such a unit with a 12MHz MC68881 into my Mega ST,
>
>I always wondered about that FPU thing. What programs are sped up?

This has been mentioned before. Some programs use the FPU, among them two
programs that I use often, which was sufficient reason for me to install it:

* Dynacadd is speeded up about 500%
* Programs written in Prospero Fortran and linked with a library for the FPU
are speeded up significantly (say, 400%-800%) depending on the amount of
floating point operations in a particular program.

I have also heard that Calamus can access this type of FPU, but I do not know
for sure, because I do not use it. I think that there is also a FPU library
for Pure C (or was it Turbo C?)

It can be imagined that a FPU would be highly beneficial to programs like,
for example, NVDI when handling TrueType fonts, but I do not know whether
this particular program can be aware of this chip.

In fact I would be interesed myself to find out what else can utilize this
chip, so if anyone knows which software can use the "SFP004-compatible" FPU,

let me know.

Djordje.

You would think so... I'll have a look at the NVDI driver but I thought it
was with SL99?

Yep, still have an SLM605 but I have a Brother HL660 attached to the Mac plus
I still have my Novajet 3 plotter. Can't run the latter because Calamus says
there is no PRT port.

Cannot believe how fast Calamus runs on a 300MHz G3.... amazing!

Keith

Hi,

Unfortunately, you had to register the software with the company (I believe Codehead was one of the US distributors, no longer exists) and they would send you a fifth disk which when installed removed the need to always have the first disk in. If the person from whom you got the software registered it, they should have another disk.

Hope this helps

Alyre

An English RSC file for jinnee 2.01 will be available soon, hopefully by the end of this month. This is compliments of Deryck Crocker and Dennis Vermier, who just recently released English translations of:
Teli 1.10
Emailer 2.0
Cab 2.7e including modules
MagiC Login
IConnect 1.7 (including tools)
FiFFi 1.10

1898. Re: Are ATARI computers Back ???? !!!!

Newsgroup: comp.sys.atari.st
Date: 1999-07-14 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199907140000.a49781@lu.maus.de>
Source record: 75981

Hello Djordje,

v> measured them by Gembench, referred to a ST with a blitter (Mega ST, that
Benchmark programs give often croppy results on emulations. Gembench is said
to give croppy results even on different 68k hardware. =:-)

v> Gemulator PaCifiST TOSBox MegaST+FPU
v> Average: 567% 469% 421% 216%
On my real work, TOSBOX is much ahead of PaCifiST, which is ahead of STonX.
The Windows based emulators (Gemulator 9x doesn't run on my system, but AFAIR
it's the same) runs twice as fast (or even faster) than the fastes DOS based
emulator TOSBOX (not to mention such goodies as more colors and long filenames).

Greetings, Oliver

Wensuite uses a serbuf4k.prg in the auto folder instead of HS Modem. It
may help your situation.

1900. ST Emulation

Newsgroup: comp.sys.atari.st
Date: 1999-07-15 00:00:00 UTC
From: Douglas Lithgow <r6164c@email.sps.mot.com>
Message-ID: <378DC929.8A037B16@email.sps.mot.com>
Source record: 75895

Many years ago, I decided I wanted an ST emulator.
At the time, I remember downloading one from the Net, but it asked me to obtain TOS from an existing Atari. I have one, but I could not be bothered with the hassle, so I forgot all about it.

However, I have regained the interest, especially as I believe old favourites like Carrier Command, etc are out on the web.

Is it still a case of obtaining the TOS yourself, or is there an easy way/method to emulate the ST on a P133 ?

1901. Re: Need help installing TOS hard disk driver (newbie question)

In message <378af7bf.98202582@news.remarq.com>, celt@nope.com said:

>OK, how do I add the icon to the desktop?

With TOS 2.06 and later you can just click on 'Install Devices' in the 'Options' menu of the desktop and it will install as many icons as the number of partitions found. You may wish to change the icon type as described below.

Alternatively, click on 'Install Icon...' in 'Options' and then on 'Desktop' in the dialog this brings up (or just press 'Return' as it's the default option). In the next dialog that appears type the letter 'C' (in capitals!) in the top line, and something like 'Hard drive' in the second line; make sure that the 'Drive' box is selected, and click the down arrow near the bottom to find a suitable icon. When you have found one, click OK and the icon should appear on the desktop. Click on it to see it works - if it does, drag it to a suitable position. Repeat the procedure with successive letters for the other partitions - if you are not sure how many here are, just keep on adding and trying them until you get a report that 'Drive X: does not exist', and then remove the last one.

With older TOSs you generally have no choice of icons and have to use the default drive icon (similar to that for A: and B:). The procedure is similar, though you have to highlight the A: or B: icon first (by clicking on one) and then click on 'Install Disk Drive...' in the 'Options' menu. Again enter 'C' on the 'Drive Identifier' line and 'Hard disk' on the 'Label' line and click on 'OK'. Then highlight the C: icon and repeat the process, changing the top line to D, E, F....

In both cases, don't forget to save the desktop after you have dragged the icons to your preferred positions, and opened any windows and/or folders that you want on the desktop when you boot up, so that everything will appear again the same way the next time you boot up (hopefully!). If you want to play 100% safe, rename the existing DESKTOP.INF or NEWDESK.INF to an .INX extension with the 'Show' Info' function of the 'File' menu before you save the new one - that way you can always go back to the original if something goes wrong. Delete them once everything is working.

Regards, /Peter/

ftp.fatal-design.com/pub/tos/

also http://lgd.fatal-design.com for games and
http://winston.fatal-design.com for a very decent and still updated ST
emulator for Windows (or) http://pacifist.fatal-design.com for a DOS based
one (that works under Windows btw).

I must note, that simple replace of ROM-chips will not be enough. Some
logic will be required, and it's best to make with GAL.
When we use GAL, then we shall move ROM area to $EOOOOO, and it will be
good for TOS 2.06. Also in this case ROM area will be not limited to 256K.
It can be much more, depending on capacity of used FLASH EPROM chips.

>

Some soldering will be needed, even in Mega ST(E). Principe will be usable
in TT too, probably.

Or use a program such as DCformat v3.0 to make a disk MS-DOS compatible
using your Atari.

You can also use an extended format: 10 sectors per track, 81 tracks
etc.

Hi Ashley! I don't use the setup routine either. I'm sure its in the docs somewhere, but all you have to do is go into the /docs folder in Aniplay and you will find an /english folder. Copy "N_FRENCH.TXT" to your main Aniplay folder, as well as copying the "ANIPLAY.HYP" file to your ST-Guide folder (usually C:\GUIDES), and you should be set. Check out the rest of the text files in the /english folder as well.

Hope this helps! ;-)

PS Oops, the docs say to put "ANIPLAY.HYP" into the main ANIPLAY folder!

Ok i pleaded for advice here not long ago......and Nicholas Bales dutifully anwsered me.....(thank you), so i picked up a megast2....a sm124 and a copy of cubase 2.0 and was given soundesigner universal and smpteTrack...(with no smptemate however......i thought that kinda rude and misleading from the guy....but he explained he sent the platinum version(that requires smpteMATE to function) only cause he couldn't find the silver or gold or whatever version supposedly works without smpteMate. I haven't gotten cubase yet and i haven't done much with the atari besides welcome it to a new home with a genorous cleaning behind the ears......took it to pieces basically besides the monitor........which from what i've been told is what i'll have to do if i want to fix the screen size it's displaying.......it's almost 2 inches to small on each side.........now there's no adjustment on the monitor exterior itself....and this guy told me i have to take it apart and adjust some horizontal and vertical pods with a plastic rod....and that i'll either get it right.....get electrocuted or fry the monitor(he made it sound so promising) he said he did it himself with his own monitor.....but suggested i take my computer down to a Good tv repair shop and have them do it........i'm not to worried about doing it myself.....and haven't worked up the nerve to take the monitor apart and find these "PODS", i just want to confirm if this is true........now my other question involves the mouse i have.....it's an original.........and it's not very nice....it looks to be in great shape....the ball and rolling wheel mechanisms work fine besides the moving parts in there could use some graphite or something to get em rolling smoothly.....but the buttons are just HORRIBLE!!!! So i guess i'd just like to know if i can get a nice quality mouse for it.........something made for the atari or some means of hooking up say a pc mouse......definetly after a mouse i'm looking into a hardrive.........all in all i'm happy though.......haven't experimented much yet but will very soon........thank you...am in the us if anyones wondering or wanting to give me a sales pitch........no problems there :)

That depends on which ISDN TA you get. If it supports 128K connects, it should support a DTE rate of at least 230K. The one I have supports 460K.

> Do you say, that all I need is to connect the ISDN T/A box to my modem port?
> Isn`t there any special commands?

All TA's have a command set. USually similar to many modems. The computer serial port doesn't know what it's communicating with, it just wants a response back.

If you are after some serious mathematical features, I recommend you
install LaTeX. It's a typesetting language/program that caters for the
scientific community (+ others). It should available from all major ftp
sites.

Later,
Karl.

Hi,

Many years ago, I acquired a "PC-Speed" hardware device which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

I do not have a Falcon now but i have a Hades 060
and is using ISDN.
ISDN modems works as modems so it is no problems to connect this.
What you need is to have as hi modem speed as you can
to take advantage of 64K or 128K.

It is realy nice to have ISDN as the connection time (with login) is about 2-4 seconds.

Yes.

Select Options/Preferences/System menu. A dialog will appear.
Mark the "External JFIF loader" box, save preferences. That's all !
Imgcopy should display jpeg's much faster.

BTW

CAB also uses JPEGD.

There was an upgrade to TW2 to use vector fonts which I got working on my STfm under NVDI but not Magic, it really doesn't like the file selector.

I even managed to get TW2 to work on my Milan under Mint but not TOS. The only thing that didn't work under Mint was the screen redraw which I forced by scrolling the window (only possible when working at double size)

For NVDI make sure all the fonts (screen and printer) have .FNT extensions and if you decide to only use vector fonts then TW2 needs to have the Zapfdingbats font. There is a work around for this but it was a hack that a cannot remember involving the font id.

I also hacked my old bitmap font documents, changing the font id's in the styles to vector font id's.

Let me make sure I understand, with HDDriver, Spin! and a DVD RAM drive I should be able to read DVD-RAM disks and CD-ROM disks.

Additional drivers are needed to read DVD-ROM disks. What are they called?

Is it possible yet to write to a DVD-RAM disk ? I assume some recording software (CD-Recorder or similar) will be needed ? Or do DVD-RAM disks work like other MO or exchangeable drives ?

On the other subject of IEEE1394 Firewire (tm) I noticed that the FreeBSD people are writing drivers. Go to Yahoo and enter "firewire" and there is a link to FreeBSD. The new Milan looks like it will have the power to edit digital video.

Peter.

1942. Atari 400s & 800s for sale

Newsgroup: comp.sys.atari.st
Date: 1999-07-16 00:00:00 UTC
From: Jim Davidson <davidson@net1.net>
Message-ID: <378FF134.5AF5@net1.net>
Source record: 75849
Cross-posted to: comp.sys.atari.st,houston.forsale

We have several Atari 400s and Atari 800s for
sale. These were in working condition when
last used. Asking price is $45 for the Atari 400s
with power supply; $55 for the Atari 800s with
power supply.

These are available Saturday July 17 and Sunday
July 18 from 8 a.m. to 2 p.m. at 5303 Allum Road
Houston, Texas. They are also available by
special arrangement if you want to e-mail me.

For folks who aren't convenient to Houston, we
can ship what you purchase, but we don't make
any guarantee about condition. If you like,
we'll turn the machine on to see what happens,
and report that by e-mail before we ship.

We also have some abandoned televisions, some of
which may work.

Regards,

Jim

For sale: Atari Mega ST4 in box with keyboard and mouse. the unit is VERY clean and MINT condition. the keyboard and mouse are clean but are yellowed quite a bit. comes with original box and manuals. i'd like to get $50/obo + shipping.

thanks!

Do you say, that all I need is to connect the ISDN T/A box to my modem port?
Isn`t there any special commands?

I need to ask because I can`t expect any support from any IP here in Denmark, that is, when I`m not using a Windoze box. Even Mac users have a hard time getting any suport.

Also at the moment I have a special Internet line, where I only have to dial a 0 to get conected. It is actually very fast and stabel, but only 28800 baud at the moment.
cheers

Hi Paul, yes I know its not called a modem, rather a ISDN T/A. There has been a sort of discussion going on here in Denmark about what to call it.
It seems to me that they agree to call it a modem, they don`t want to confuse all the newbies/ non technical people. To most computer illiterate it is the same, a box that connect the computer to the internet.

Don`t ever try to explain to a person, that just got her first Windows machine with everything preinstalled, - what a modem does.

Sorry, I'm refering to iMacs of course!!

Some hotel latrines I have seen have these plastic hand-soap
dispensers stuck on the wall. They have a translucent lid on
top that lets you see how much soap is left. It had occurred
to me that they look remarkably like iMacs!! (or vice-versa)

Thats why I wonder if Apple have breached a patent on a soap
dispenser design!!

;^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The archive is called MAGCISLM.ZIP and is available from my web site
(address below).

If a fresh download fails to cure your problem then I'm afraid that that's
it - the author dropped support a long, long time ago. I do have the source
code tho', but I've absolutely no idea what to do with it! ;-)

>anything yet, and I still need to get a null modem cable for the G3.

The best way to test it is to set your HP printer driver to print to a file
and use magcislm to print that to your laser. If that's OK then have a go at
the null modem connection.

>Do you say, that all I need is to connect the ISDN T/A box to my modem port?
Yes !
Just be sure that the T/A can handle 57600 as i think this is the max usable speed on a
Falcon
(correct me if i am wrong here)
Running 128k on your Falcon is not ultimate as the serial port is slower.

>Isn`t there any special commands?
Yes there is special commands to change how the T/A will work but normaly you do not need
to change these settings.
To do a connection it acts like a normal modem
with ATD dial commands and CONNECT responds.

>I need to ask because I can`t expect any support from any IP here in Denmark, that is,
>when I`m not using a Windoze box. Even Mac users have a hard time getting any suport.
This is the same problem when using analog modems.

Thank`s Erik

At the moment I`m running 57600 on the port, using I-connect. I did try 115000, but it was a little unstabel, or so it seems to me. Then again, it was with a 28800 baud modem.

>To do a connection it acts like a normal modem
>with ATD dial commands and CONNECT responds.

Then I can use the normal commands in the dial program? Hopefully!

Thanks to all for your hints and comments. I have gone back to Magic 5
and all is well. Has any one got info on the various parameters in
Magx.inf that are readable by 5 and 6. The manuals of course are not
very helpful. In particular, I found that the tiling effect, ie the .IMG
file used, on desktop, is not controlled by 'tiles' in #boot, but by a
much later parameter in the desk section. Moreover this parameter does
not seem to be accessable from the Magx.inf setup prog. and I had to
hard wire it in a text editor, to change tiles.

Have just seen what looks to be a very good graphics package, called
'Vision' at URL:

http://www.multimania.com/jlusetti/visione.htm

RSC and 'manual' seem to be in french, but its shareware and we
shouldn't be greedy!!
It's optimized for the Falcon, using the DSP. I'll download it tonight
and compare with photoline.

The Falcon might be slow, but for something the size of two lunch boxes
side by side, its bl**dy versatile!!!

Bob-King.

A plain Falcon with MagiC can use 115200 without any problems at all. I have never owned a modem that could handle higher speeds, so I don't know how well 230400 will work on a standard Falcon.

115200 does not work properly with TOS, and since I don't have a 030-Falcon anymore I don't know how the new MiNT-versions copes.

My Falcon with Afterburner handles 115200 without problems regardless of OS. 230400 will probably work fine too, but I have not been able to test that.

Bob, I recently fetched 3.5 from a server. Before I had 3.0 (I think). The
latter wouldn't load JPG's, but 3.5 does. Nice piece of s/w. After
installing, you can opt for an english rsc file.

There is some need for docs in english, tho'
Also, 3.5 seems to be more stable on MagiC than the older ones, tho' not
completely stable. But I'm considering registering for those 35 dollars!
Really a nice program.

I have, although it was only single sided discs, or 11 sector DD or
21/22 sector HD floppies. The strange thing is I still DSDD discs
formatted under the TOS 1.0 desktop and these are completely accessible
to Win95/98, DOS 3.3, 4, 5 and 7, and DRDOS 6.

Oh sorry !
Better solution is to copy N_FRENCH.TXT (directory english) in Aniplayer
directory. This file contains english texts. After you can copy ANIPLAY.HYP
in the same directory or your user directory for ST-GUIDE.
Joachim Formallaz is the author of GEM-Setup (made on MagicMac).
GEM-Setup works fine on my FALCON (TOS 4.02 or Magic), but now I have a CT2
and normal mode isn't 100% compatible :-(Sometimes some bus errors (2 bombs)
are not detected. I use an MMU-patch, but this patch works only in turbo mode
(and with fast-ram)... For install OLGA and variables, GEM-Setup uses differents
files Newdesk.inf, Magic.inf, olga.inf, etc.. So please, send me your
configuration (with a Sysinfo) or send a mail to Joachim at this adress:
jfornall@stud.ee.ethz.ch

Well Folks,
One of the nicest guys (I prefer girls, don't worry about that) comes from la Belgique ! He was out of order for nearly 4 months but now he's back and ......on holidays.But that doesn't matter, you can mail him again, send him flowers , German beer, French cheese, Finnish wodka, Italian pasta, whatever.
Our Dennis is back in town
Hopefully he stays there !
Jos

Only CAD thing I can find is an issue with MASTERCAD on the disk. If you mean this, then I have a as new spare mag and disk!

If anybody else requires missing copies of ST Review and original cover disks, then feel free to contact me for a list. I do have a small amount of spare copies of various issues available.

Ahh... I see what you mean. Unfortunately, if I view a JPEG (with the
DSP decoder) it will freeze up the computer regardless of which program is
making use of the decoder (Image Copy 4 or the JPEG.ACC or CAB). It seems that
any program that makes use of the DSP-loader causes a lockup when the Falcon is
"cold".

I guess under MagiC 5, my DSP needs to "choke" on it's first JPEG of the day
before it can perform correctly. But I've learned to live with it.

The highest rate (I think) usable on Falcon is 230k4. I've never used this
rate with a modem or ISDN TA, but have used null-modem at that speed. Its
quite nice being able to send a megabyte down the line in around 35 seconds
but I've never managed to get the uploads to that speed yet...

You will need HS-modem AFAIK to access that port rate...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Looking for information on the PolyDisk and MegaDisk.
AFAIK these were ST cartridge Ram Disks or Ram Drives?

If you have one of these, could you e-mail me a description
of what it looks like and any other info?

I have a unidentified cartridge here and it just might be
one of these.

Also interested in diagrams, pictures or anything that would
describe how to build a cartridge ramdisk for the ST and Falcon.

Thanks,
phantomm@kih.net

The Atari Software eXchange

Updated: Saturday 17th July 1999

I have the following Atari gear for sale. Prices do not include
postage.

Prices are in GBP's (Sterling) and I'm also willing to accept USD's.

As usual I will consider part exchanges or swaps for other Atari St,
Jaguar, Portfolio etc. hardware or software.

Things I'm on the lookout for:
Atari CD-ROM's, reference books, EPROM Programmer that can do 32-
pin DIL chips.. or anything that tickles my fancy;)
****

Atari ST Compilation Packs
Atari STE Discovery Xtra Pack, featuring:
Final Fight, Sim City, Escape from the Planet of the Robot
Monsters, 9 Lives and the Language Disk. ..... ï¿½5

Atari 520STE Turbo Pack, Featuring:
STOS, Hyperpaint 2, Music Maker 2, FirST BASIC, Blood Money,
Anarchy, Human Killing Machine, Impossible Mission, Dragon's
Breath, Indianna Jones and the Last Crusade, Outrun, and Super
Cycle. ..... ï¿½15

Compilations
ï¿½3 Each
Top Shots, featuring: Kick Off + Extra Time.

ï¿½4 Each
Hollywood Collection, featuring:
Ghostbusters II, Indiana Jones and the Last Crusade & Robocop. No
Batman or instructions.

ï¿½5 Each
Champions, featuring:
Manchester Untied, World Boxing Championship & Jahangir Khan
Squash. No Box.

TNT, featuring:
Xybots, Toobin, APB, Dragon Spirit & hard drivin'.

Mega-lo-Mania & First Samurai.

Educational
ï¿½4 Each
Learn to Read with Prof. Level 1. Ages 4 to 9. Not STE.
Mickey's Runaway Zoo (Disney Software) - Learn Numbers for 2-5 years.

Adventure, Strategy, Puzzle & Trivia type
ï¿½1 Each
Spidertronic

ï¿½2 Each
Crash Garrett
Go-Moku/Renju
Quizam!
Skweek
The Quest for the Time Bird
Tower of Babel

ï¿½3 Each
Advanced Dundgeons and Dragons 'Heroes of the Lance'. No box.
Borodino
Chess Player 2150
Corporation
Curruption. No Box.
Driller. Including a model of the planets surface.
Dungeon Master Editor. No box.
Dungeon Master Expansion Set #1 - Chaos Strike Back & Utility Disk.
Federation of Free Traders (F.O.F.T.). No box.
Lords of Chaos
Murder

ï¿½4 Each
Operation Stealth

ï¿½5 Each
Carrier Command
Kings Quest I. No Box.
Kings Quest II. No Box
Kings Quest III. No Box.
Buy all 3 Kings Quest Adventures for ï¿½15 inc. postage (UK only).
Leasure Suit Larry in 'The Land of the Lounge Lizards'.
*** WARNING ***
Leasure Suit Larry contains ADULT Material.
Parental guidance is suggested.
Powermonger including World War 1 edition
Shadowlands
Space Quest. No box.
Terrorpods

ï¿½7.50 Each
Civilization. 1 meg. No Box.
Midwinter II Flames of Freedom. 1 meg.

ï¿½10 Each
Frontier - Elite II. 1 meg.
Indy - Indianna Jones and the Last Crusade 'The Graphic Adventure'
(6 disks). I've no idea if this needs 1 meg! It comes with The
Arcade game as well.
Populous II. Both 1 meg and 512k versions.
Railroad Tycoon. 1 meg.

Simulations
ï¿½2 Each
Hunter Killer

ï¿½3 Each
Falcon The Mission Disk Volume 1.

ï¿½5 Each
Battlehawks 1942
Falcon. The F-16 Fighter Simulation. ï¿½7 including Mission disk 1.
Flight of the Intruder. Additional Features for 1 meg owners.
Gunship
Mig-29 Fulcrum. 1 meg needed.

ï¿½7.50 Each
Formula One Grand Prix (Microprose)
M1 Tank Platoon

ï¿½10 Each
F-19 Stealth Fighter.
Knights of the Sky. 1 meg.
Reach for the Skies. 1 meg.
Silent Service II. Requires 1 meg.

Sports
ï¿½2 Each
Football Director II
Hyperbowl. No Box.
Super League Soccer
World Cricket

ï¿½4 Each
Kick Off 2 + World Cup 90

ï¿½5 Each
Sensible Soccer. 1992/3 Season Edition. Computer Game of the Year '93.

ï¿½10 Each
Championship Manager End of 1994 Season Data up-Date disk.
Comes with Championship Manager (1 meg) and Championship Manager
Italia. Altogether 8 disks.

Arcade
ï¿½1 Each
Nitro Boost Challenge

ï¿½2 Each
Alpha Waves
Bad Company
Ballistix
Cabal
Defenders of the Earth
Fast Food. Featuring Dizzy.
Flood
Formula 1 Grand Prix (not Microprose)
Hard Drivin'
Hong Kong Phooey
Mean Machine
Outrun. No instructions, you don't need them.
Popeye 2
Robocop
Steg The Slug
The Light Corridor
Whirligig
Yogi Bear & Friends in the 'Greed Monster'

ï¿½3 Each
Awesome
Barbarian (Palace). The one with gladiator 'Wolf' on the box.
Barbarian (Psygnosis)
Cap'n Carnage
Captain America. No Box.
Championship Wrestling
Chase HQ II. No Box.
Combo Racer
Daley Thompson's Olympic Challenge. Not STE.
Defender II
Dragon Breed
First Samuri. No Box.
Golden Axe
Harley-Davidson 'The Road to Sturgis'
Hudson Hawk
Impossamole
Mach 3
Menace
Monty Python's Flying Circus. No Box.
Operation Thunderbolt
Oxxonian
Prince of Persia
Risky Woods
Robocop 2
Shadow of the Beast
Speedball 2
Spindizzy Worlds
Spitting Image
Star Breaker (Brand New) Still Shrink wrapped.
Star Wars

Super Hang-On
Switchblade II
Teenage Mutant Hero Turtles
Test Drive
The New Zealand Story
The Simpsons - Bart V's The Space Mutant
The Untouchables
Thunder Blade
Total Recall
Vigilante
Wizkid. No Box.

ï¿½4 Each
Ghostbusters II
Lotus III

ï¿½5 Each
Street Fighter II

1978. [HELP] PC-Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <7mpjp4$8t8$1@nnrp1.deja.com>
Source record: 75861

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

french-lines@usa.net

Alternatively, anyone know if this SACK Electronic GmbH is still around ?

Who !Thanks for the comparison...

> Bob, I recently fetched 3.5 from a server. Before I had 3.0 (I think). The
> latter wouldn't load JPG's, but 3.5 does. Nice piece of s/w. After
> installing, you can opt for an english rsc file.
VISION 3.5 can handle "progressive encoding", that the 3.0 can't handle.
But the most important thing is that now the version 3.5 can load JPEGs
WITHOUT the Brainstorm's DSP driver. That is to say that every ATARI can now
load JPEGs with VISION 3.5.
This RSC file has been translated by me and improved by Hallvard Tangeraas.

> There is some need for docs in english, tho'
> Also, 3.5 seems to be more stable on MagiC than the older ones, tho' not
> completely stable. But I'm considering registering for those 35 dollars!
> Really a nice program.
Thanks again ! Could you report me bugs about the "not completly stable on
MagiC" ?
I'm looking for persons who are able to translate the French HTML doc into
English one (I really have no time to do this).
If someone is interested, I will life-register him to VISION !

Does somebody dare to translate it ?

See you, Jean

But why spend $$$ on a (admittedly cool) machine just to run a boring OS
(Linux) which is identical to the OS you can run much faster on a much
cheaper machine?

I would never dream of running Linux on my Ataris, especially not since I
already own a 486/66 that I got for free and runs linux better and faster
than even my Falcon with Afterburner...

Hi

I've come across this site that offers to pay for your internet time, full details are at the web site. It doesn't cost anything and unlike the other one, I don't think it needs a minimum referral.

Below is the wording they use. Please put me down as the referrer. My ID is: lastpd

Hi,

I just found a cracking London based web site that pays for my time on-line. You can earn 25p per hour when you download their software. If you refer friends you earn 10p per hour for the time they spend on-line and 5p per hour for the time that all the people they refer spend on-line.

This is a winner.

Click on the below link:

http://www.sharkhunt.com/join/join.asp?shID=lastpd

Thanks

-- Cheers! For Now

1985. 'Team Atari' SETI search

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: Joe Mirando <jmirando@portone.com>
Message-ID: <37909CC1.81DB74BE@portone.com>
Source record: 75868

Hey folks,

I just started 'Team Atari' on the SETI@home home page. If you're an 'Atari person' and have access to a PC, Mac, or Linux machine, and want to join in the search for signals from an extraterrestrial intelligence join up!

For those who haven't heard of SETI@home, I'll explain a bit:

SETI@home is a novel idea in the realm of the Search for ExtraTerrestrial Intelligence. What it does is allow your computer to analyze data generated by the Arecibo Radio Telescope in it's spare time. A screen saver program downloads a piece of data from the internet, analyzes it, forwards the results to the server (located at the University of California at Berkeley, I believe), and gets another piece of data to analyze.

So far there are more than 800,000 people participating in this venture, which in effect makes SETI@home the world's largest super computer. To date this project has put in more than 29,000 YEARS of CPU time looking for a signal that might be from an extraterrestrial intelligence.... and it's only been up and running for about eight weeks! The project is scheduled to run for two years.

Unfortunately there is no version of this application for the Atari line of computers. But if you still consider yourself an Atari Person even though you use a PC or Mac (either instead of or in addition to your Atari) and want to join in the search, go to the web addresses listed below, download the screen saver, and join Team Atari.

We Atari users have always been pioneers, haven't we? Well what better way to continue that spirit could there be than to join SETI@home? We've often been told that we're "out there", right? Well wouldn't it be cool to help detect the first intelligent signal from 'out there'?? And it would be even cooler if that first signal said "Atari Rules!"? <smile>

I had thought about asking the managers of this project to consider producing a software version for Atari computers, but I doubt that the end result would be worthwhile. A 366 MHz Pentium II PC takes approximately 18.5 hours to completely analyze a piece of data. Even a souped up TT or Falcon would take considerably longer (although the Falcon's DSP might help).

In addition to the versions I've mentioned already (PC, Mac, Linux) there are also other versions available, and the web pages are available in 20 different languages.

If you're interested, go to the following site and read about the
project, results, and how to join...

http://setiathome.ssl.berkeley.edu/

If you want to add your computing power to Team Atari, go to this site:
http://setiathome.ssl.berkeley.edu/cgi-bin/cgi?cmd=team_lookup&name=Team+Atari

Hope to see you there,

Joe Mirando

Yep, it will! Up to now this 'MintNet goes MagiC' project has been
implemented using the 'old' methods, ie Ruftrade ;-)

>One of the goodies that I hope will result is the wherewithal to use a
>MiNTNet overlay with CAB.
>
It will bring better networking, more clients and servers and more
compatibility. MintNet's CAB.OVL does not work for the moment since
it searches for a MiNT cookie ;-(The same is true for aFTP and some
others I've tried, just to begin debuging. I beleive that from now on
MintNet authors will check for u:/dev/socket only ;-) Fortunately
CAB.OVL's sources are available, it should be easy to port it (I had
almost done it for STinG when Olivier released his CAB.OVL).

Btw, what is wrong with Olivier's CAB.OVL ?

1988. Help tool for translating RSCs

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: papval@mail.otenet.gr
Message-ID: <3790c3464798792@mail.otenet.gr>
Source record: 75871

Hi all

I've written a small utility program that helps in the translation process of RSCs (with 38 degrees Celcius, what else could I have done, having to stay home ;-)

It is a GTP (RSC_TRAN.GTP) and works like this:
At first one drops a RSC file on its icon and it produces a same name TXT ascii file, containing all text fields of the resource (including alerts and free strings).

Then this text file can be passed from Ruftrade or Gemtrade (or a text editor) for translation. The result should be a .RUF or .ENG file.

Last, this translated file is again droped on RSC_TRAN's icon and it will load, modify and save the resource file. Ready!

Note that the program will take care of the field's length, so lines wider than the original will be clipped (thus it is a good idea to load the modified .RSC to a resource editor for a final touch :-)

During tests it took less than half an hour to translate PAPILLON.RSC and about 1 hour to translate jinnee! The program itself takes just seconds (of course;-) but since Ruftrade will not respect upper/lower case, some editing is required. Doing it on a text editor though, one has all the usual tools, ie search and replace etc.

One other thing I find helpful is that keeping the .ENG or .RUF files, future updates of the same program (eg jinnee) will take just minutes to update.

If we don't have such a utility, I'll put it on my homepage in the next 24 hours (I'm painting my computer room now ;-)

Is there an Atari graphics program that can read the .WMF (Windows Meta File?)
graphics format? I recently aquired a few CD ROMs with tons of these
WMF images on them, but Image Copy 4 doesn't recognize the format.

1993. PixArt 4 (English version)

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7mqla6$1088@enews2.newsguy.com>
Source record: 75876

Anyone here use the English version of PixArt 4? (version 4.34 to be exact)

I got it a couple months ago and I must say I am very disappointed (especially given the fact that it cost me $70 US). I have yet to get it to work correctly under MagiC 5 (on a Nemesis-enhanced Falcon):

First, for some reason [under MagiC in 256 color mode] it takes about 1 minute to actually load and come up on screen (it loads in a few seconds under TOS, and yes, the fastload bit is set). This isn't a big deal to me though. However, once loaded, it simply won't work. All images are a scrambled mess of garbage - even the "About PixArt" title screen graphic is a mess. This happens regardless of whether Nemesis is on or off.

And [under MagiC in True Color and 16 color modes] the load time is only a few seconds, the "About PixArt" title scrren graphic is ok - but any attempt to load an image gives me the following error messages:

"File not found"
"Unknown file type"

(Of course the files in question are fine, and load into PixArt 4 without trouble under normal TOS).

Now [under normal TOS] the program loads, the graphics are ok, and images _can actually be loaded into the program_ (wow, what a concept!). But, I've had more troubles there as well:

I loaded in a scanned JPEG image I was going to use on my web site. I simply wanted to clean up the scan, getting rid of any empty space around the edges. It seemed to be working ok, but the first time I saved the edited image, and tried to reload it, I got an empty window. After reloading the original, and re-doing the edits, I again saved it. When I reloaded it, the image seemed to have a vertical white line on the left side of it, and there was also a vertical white margin on the right side of the image as well (neither of which were there before I saved it).

Well, after more trial and error, I finally got an edited image to save correctly. However, PixArt 4 seems to always insert a narrow white vertical margin on every picture I save from within the program - even if I haven't done anything to the image in PixArt 4. I tested this by loading in an image, viewing it in PixArt 4, then re-saving it in PixArt 4. The re-saved image now contained a narrow white vertical margin.

Finally, I've also had the program crash with various errors numerous times (obviously under regular TOS as it appears to be unuseable under MagiC).

All this for $70 US and no manual. Is it just me???

Anyway, I think I'll get Positive Image 2. It looks good on paper and the price is reasonable. However, I noticed in the recently posted ad for it that there was no mention of GIF support. Is it in there?

1997. Looking for TT utils

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: thaanuj@kira.peak.org
Message-ID: <7mrr1t$d77$1@kira.peak.org>
Source record: 75880

A couple of years ago I suffered a massive HD failure and lost
everything. I bought a new drive and re-installed all the important
stuff, but didn't bother with any of PD/freeware games that were lost.
This evening I was a little bored, so I snooped through the ftp sites
and downloaded some of my old favorites. Then I remembered that
many won't run on my TT because these old games expect to be running
on an older, slower machine.

I seem to recall that I had a util to slow my TT down, and another
that changed the memory addressing from the normal TT (32 bit?) to
the earlier ST addressing (24 bit?). When both of these were running,
just about anything would work on my TT. But now it's been so long
I can't remember what these utils were, or where I found once found
them.

Can anybody help me out with filenames and a site to find them on?

Thank you.

1998. Are ATARI computers Back ???? !!!! (Long)

Newsgroup: comp.sys.atari.st
Date: 1999-07-17 00:00:00 UTC
From: Grings <grings@bigfoot.com>
Message-ID: <fpjk3.226$O5.201@news.indigo.ie>
Source record: 75881

I've read pretty much the whole of this thread and I have to say it's been interesting - but some bits have also been amusing.
Personally, I don't use TOS machines anymore. I'm pretty much 100% PC these days. Although recently I've been messing about with the new version of Gemulator running lots of my old software - NoSTalgia is the word. And congrats to those who are still using their STs as their main computer.
However, some of this near-religious PC bashing is a bit funny. The main reason I bought a ST back in 89 or so was because it still was 'Power without the Price'. Now that a complete PC system can be bought for less than 300UKP including VAT (but ex the Microsoft tithe), the Atari scene looks hopelessly expensive.
Of course, it is small market. But even a few years ago, software for the TOS market was expensive. I mean Calamus SL cost around 500UKP, DA's Layout about the same, Tempus Word Pro was 600DM. Even back then PC software was cheaper - for the price of Tempus you'd buy the full version of MS Office, the Lotus or WordPerfect Suites were much less.
Sure, I've used Tempus Word Jnr extensively and it really is very quick - MS Word needs a quick 486 to approach these speeds. But on today's machines it really flies. And of course, if you do go back to using something like Tempus after having used for a few years, you do realise that some important features are missing. Like for instance UNDO, proper scaleable fonts (the latest version might have those now I suppose), proper printer support (the old TOS bugbear), proper copy and paste oh and UNDO (did I mention that already?)
Also, I�m not surprised that Steven Kaleita has problems printing from Calamus SL under MagiCMac. I have to say I hate that horrible Postscript dependence that Mac�s have. I wonder what printing speeds would be like with a PC printer connected with PowerPrint? Calamus & MM seem to sending the whole print job as a bitmap so no wonder there. (1200x1200x11x17/8 = 32MB so 22Mb might not be enough.)
Of course, x86 CPU do generate a lot of heat. But I�m sure that the first 68030 generated a bit of heat too. Back when Atari released the Falcon, 16Mhz 030 were a bit of a joke hence on most Falcon�s the 030 can cope with 32Mhz without any problem. It would far more interesting to know if the CPU in a Mac SE/30 or IIci can cope with 32Mhz. After all, if Intel were still making a 100Mhz Pentium with today�s technology it would probable not even need a heatsink it�s just that there aren't any 0.18 micron CPU running at 100Mhz around. (Actually, the IDT Winchip uses very little energy - and that's despite running at 3.5v.)
I have to agree that PC�s do take way too long to boot. One of the main problems seems to be PnP maybe once ISA has been eliminated, Windows won�t have to probe for every I/O, DMA, or IRQ combination every time it boots.
BTW, Win98 and Win95b are pretty much the same. I haven�t had any real

problems with either and certainly graphic updates are always quick. But then I never had the "Active Desktop" enabled"
Also, modern x86 CPU are definitely much faster than any 68k processor " although I haven"t seen any definite benchmarks. The only benchmark that really springs to mind would be POVray or SPEC95 etc. But since I only have access to a plain STe without an FPU and since my DOS version of POV is rather old I haven"t tried it. Does anyone have the results for the same POV scene on a number of machines?
Having said that, back when Apple had to compete with 040 vs. 486, the 040 definitely had the quicker FPU. But on the Pentium and then the Ppro / P II the FPU was hugely improved. Still, I believe the G3 FPU is faster than Intel"s " the integer performance of the PPC chips isn't too good however.
I'm not a great Mac fan, but Steve Duff"s comments regarding Mac programmers is a bit unfair. You just have to look at the UK Mac magazines to realise that there's a huge PD and shareware market for the Mac- MacFormat for instance regularly has 200Mb of new shareware on their CD. While all the PC magazines rarely have any shareware on their cover CDs.
Okay, so no one programs demos but that's perhaps just as well. I was never into the demo thing anyway. And of course, with a machine like the Mac where hitting the hardware directly is definitely not on - everything needs to go via the OS. This is not a disadvantage - if everyone wrote programs dependent on the hardware Apple would never have been able to do such a good job with the transition to the PPC.
Think about this: one of the reasons the Amiga never really evolved very much is because of the tight integration of the chipset. This was a blessing back in the mid-80's when most machines had no sound and no graphic accelerators. This is another
reason why UAE is so slow. The ST was less dependent on the chipset so it has made better transition to being a viable emulator candidate. I have seen MagiCMac, it really does fly - buying a reasonable '040 Mac for next to nothing (for instance at misc.forsale.computers.mac-specifit.systems there are Centris 650s [20Mhz 68LC040] for 24USD) and running MagiCMac on it is a far cheaper and faster alternative to finding a second-hand TT or Falcon.
While the MacOS & apps are hardly dependent on the chipset / hardware - hence emulators like Fusion or Executor are really quite quick. [Just a pity that no Mac emulator will run MagiCMac.]
Of course, new Macs are horribly overpriced compared to PCs. Like lots of PC users, I have no intention of ever buying a whole system ever again " rather I upgrade a bit here and there " on AppleLand that is not possible.
The lack of the floppies on the recent models is a horrible joke. (BTW, since Apple uses special motorised floppies, this saves Apple a lot more than the $10 everyone seems to think.)
Finally, I really think that it would be a good idea if a few of the ST emulator guys got together and wrote the perfect emulator :-)
I"d love there to be a quick emulator aimed at apps which would use the Windows GUI for VDI functions (running only under DOS would be a mistake since you'd be limited to a very generic machine) and come with support for at least 256 colours. Of course, this would be a mammoth task"

Yes, but you will need a host adapter as well to convert ACSI (from the Hard
Disc port) to true SCSI.

> I am also interested in obtaining some software: second hand, PD,
whatever.
> Any pointers as to where I could find some?

Go for the PD, Shareware stuff. There's loads of good things around. Try
ftp.funet.fi and UTSI.

> Question is as expected: How can I use one Epson Stylus 640 with my 1040
>STE ?

Not necessarily as expected.. it could have been lots of other things as
I don't speak/read German or whatever language it is.

The author did drop me a line to explain what they wanted and gave me
more info.

>
>My reply would be: Write driver yourself for it, if you want print in color.
>(Maybe I'm wrong, and there is such thing ?)

For some people who can do that sort of thing, there's no problem. It's
like asking 'anyone know of a game like this' and then being told 'write
it yourself, if you want to play a game like that'.

Fortunately I have the same model printer, of which the actual manual
you need to use is a CD-ROM. The manual in paper form only tells you haw
to find a plug socket and plug it in and change ink cartridges etc.

I've not installed my manual yet, but one day I may be using my Atari to
access the printer via an Ethernet network.

As I've not had look at it, there may be a good chance that it's going
to be a PC ONLY CD:(which means those who can't use it won't be able to
get the details that's needed.

This is what the person needs:

A driver so that they can printer from within Notator or Creator
packages.

My guess would be that it's a GDOS type of driver that's needed.

The printer is different from the Epson Stylus Color 400/500/600,
including ink cartridges, so would presume it's different in other ways.

It has a 14400 dpi resolution.

I know programs to create printer driver for GDOS etc. exist, I may have one and not know about it! at the moment no program springs to mind.

ATB

2001. Re: Are ATARI computers Back ???? !!!! (Long)

Newsgroup: comp.sys.atari.st
Date: 1999-07-18 00:00:00 UTC
From: Steve Stupple <Steve@atari.org>
Message-ID: <7HLYuMACwek3Ewj6@steverosie.demon.co.uk>
Source record: 75797

On Sat, 17 Jul 1999 at 23:01:00 a message from Grings was created on the subject of Are ATARI computers Back ???? !!!! (Long).
>I've read pretty much the whole of this thread and I have to say it's been >interesting - but some bits have also been amusing.

I haven't read the thread as I presumed from the first article it would have the same speeches that have been mentioned before. But I found this reply, as it was separate from the main thread, amusing.

>Personally, I don't use TOS machines anymore. I'm pretty much 100% PC these >days.

I'm proud to say that I'm NOT 100% PC. I have never had the problems on any of my Atari's that I have had in the last7 days on a PC, and I am talking of YEARS of Atari use. (Was it 1986 I got my first Atari!!!, I can't remember).

> Although recently I've been messing about with the new version of >Gemulator running lots of my old software - NoSTalgia is the word.

I wouldn't say nostalgia, unless it was your first computer of some time ago.

Now going back to my first computer supporting a magnificent 1k of memory, in glorious black and white and the only sound was that of frustration when the typing disappeared when you started to run out of memory; the year 1981, the machine the ZX81 (I'm starting to feel old a little):)

> And
>congrats to those who are still using their STs as their main computer. >However, some of this near-religious PC bashing is a bit funny.

Funny may be but more than likely true!

> The main
>reason I bought a ST back in 89 or so was because it still was 'Power >without the Price'. Now that a complete PC system can be bought for less >than 300UKP including VAT (but ex the Microsoft tithe), the Atari scene >looks hopelessly expensive.

When you compare the Atari memory efficiency, you may be surprised. In anything new or old you will always find reasons for against.

What the Atari can do in 100k it takes the PC users 100Meg...

>Of course, it is small market. But even a few years ago, software for the >TOS market was expensive. I mean Calamus SL cost around 500UKP, DA's Layout

>about the same, Tempus Word Pro was 600DM. Even back then PC software was
>cheaper - for the price of Tempus you'd buy the full version of MS Office,
>the Lotus or WordPerfect Suites were much less.

Software prices for the Amiga/Atari ST have been pretty static, a full
price game on tape has always been around ï¿½10 GBP, around the same price
as games consoles!

The average price of a serious application for the PC is HIGHER than the
games consoles!

Compare shareware software, the Atari user can expect to contribute
amounts in POUNDs, the PC on the other hand we are talking TENS of
POUNDS.

To buy Calamus SL for 500GBP you must have been going back when the
Atari cost around ï¿½400-500 GBP, and when memory upgrades were just under
ï¿½100 to upgrade a 520STFM with either an internal double sided drive OR
half a meg of memory.

>Sure, I've used Tempus Word Jnr extensively and it really is very quick - MS
>Word needs a quick 486 to approach these speeds.

Exactly, it needs a faster processor to be able to MATCH the
capabilities of a bog standard STFM!! all time is wasted with L-A-R-G-E
disk accesses in megabytes rather than bytes on the Atari, or event he
Amiga, side.

> But on today's machines it
>really flies.

I would hope so, some of the software I use takes ages on the PC. It's
quicker to start my ST up, load in a word processor, type a letter,
print it and switch off before the PC is ready!!!

> And of course, if you do go back to using something like
>Tempus after having used for a few years, you do realise that some important
>features are missing.

Really!

> Like for instance UNDO, proper scaleable fonts (the
>latest version might have those now I suppose), proper printer support (the
>old TOS bugbear), proper copy and paste oh and UNDO (did I mention that
>already?)

I've never needed to use an UNDO feature, so is more than likely one of
those 3000 features everything has got but only 1 feature used.

Printer support: Fine, my dot matrix printer (Swift 140C) has 11 fonts
(2 of which are fully scalable). This leaves my PC standing, as I can
use the INTERNAL printer fonts it came with! the PC on the other hand
has to print one row at a time, NOT using internal fonts AT ALL.

Guess which is faster!

I have just got an Epson Stylus Color 640! the salesman boasted all the
fonts it has blah! blah! blah! I was shocked to find that PC software
STILL doesn't utilise the internal fonts the printers have in them.

Now an old program, I believe it's called Write On!, that also switches
BETWEEN graphics mode and text mode when it comes across graphics.

>Also, Iï¿½m not surprised that Steven Kaleita has problems printing from
>Calamus SL under MagiCMac. I have to say I hate that horrible Postscript
>dependence that Macï¿½s have. I wonder what printing speeds would be like with
>a PC printer connected with PowerPrint? Calamus & MM seem to sending the
>whole print job as a bitmap so no wonder there. (1200x1200x11x17/8 = 32MB so
>22Mb might not be enough.)

And PC software doesn't!!! Sorry, I forgot that's why you have to use a
Pentium III processor to match it!, sorry I nearly forgot the Memory
that's needed.

>Of course, x86 CPU do generate a lot of heat.

a Lot of heat! it gets HOTTER than one of my STFM's power supplies and
that doesn't have a fan!

> But Iï¿½m sure that the first
>68030 generated a bit of heat too. Back when Atari released the Falcon,
>16Mhz 030 were a bit of a joke ï¿½ hence on most Falconï¿½s the 030 can cope
>with 32Mhz without any problem. It would far more interesting to know if the
>CPU in a Mac SE/30 or IIci can cope with 32Mhz. After all, if Intel were
>still making a 100Mhz Pentium with todayï¿½s technology it would probable not
>even need a heatsink ï¿½ itï¿½s just that there aren't any 0.18 micron CPU
>running at 100Mhz around. (Actually, the IDT Winchip uses very little
>energy - and that's despite running at 3.5v.)

Tell me one computer or OS that has been produced having a few bugs,
each version is suppose to be an improvement. Microsoft's Windows '98
doesn't follow those rules, users have to pay for the privilege to test
Windows 2000!!!

>I have to agree that PCï¿½s do take way too long to boot.

I totally aggree, 1000000000%;)

> One of the main
>problems seems to be PnP ï¿½ maybe once ISA has been eliminated, Windows wonï¿½t
>have to probe for every I/O, DMA, or IRQ combination every time it boots.

It doesn't do this every time it's booted, it only check if it's there
and on some hardware it doesn't check at all. Otherwise I would NEVER be
able to boot up at all.

>BTW, Win98 and Win95b are pretty much the same. I havenï¿½t had any real
>problems with either and certainly graphic updates are always quick. But
>then I never had the ï¿½Active Desktopï¿½ enabledï¿½

You have been spoilt! I use Windows '98 and have had major problems when installing software.

Installing Win 98, this is a little of a gamble. You would think it would install things the same way every time... You have NO chance, the installation is a little like Russian Roulette..

>Also, modern x86 CPU are definitely much faster than any 68k processor ï¿½
>although I havenï¿½t seen any definite benchmarks. The only benchmark that
>really springs to mind would be POVray or SPEC95 etc. But since I only have
>access to a plain STe without an FPU and since my DOS version of POV is
>rather old I havenï¿½t tried it. Does anyone have the results for the same POV
>scene on a number of machines?

I've never tried the software on either the PC or ST, so can't comment.

>Having said that, back when Apple had to compete with 040 vs. 486, the 040
>definitely had the quicker FPU. But on the Pentium and then the Ppro / P II
>the FPU was hugely improved.

Why did the drop the Ppro series! so quickly after it's launch and without the usual press release about discontinuing them!

> Still, I believe the G3 FPU is faster than
>Intelï¿½s ï¿½ the integer performance of the PPC chips isn't too good however.
>I'm not a great Mac fan, but Steve Duffï¿½s comments regarding Mac programmers
>is a bit unfair. You just have to look at the UK Mac magazines to realise
>that there's a huge PD and shareware market for the Mac- MacFormat for
>instance regularly has 200Mb of new shareware on their CD. While all the PC
>magazines rarely have any shareware on their cover CDs.

I've not come across ANY PC CD that doesn't have some PD or sharware. They do have plenty of demo type applications, mind you some PD libraries call these PD/shareware.

>Okay, so no one programs demos but that's perhaps just as well. I was never
>into the demo thing anyway.

I'm not into demo's but saying that 'no one programs demo's' is like saying no one does programs.

> And of course, with a machine like the Mac where
>hitting the hardware directly is definitely not on - everything needs to go
>via the OS. This is not a disadvantage - if everyone wrote programs
>dependent on the hardware Apple would never have been able to do such a good
>job with the transition to the PPC.

I'm getting a feeling that you are a greengrocer;) an Appleman!

>Think about this: one of the reasons the Amiga never really evolved very
>much is because of the tight integration of the chipset. This was a blessing
>back in the mid-80's when most machines had no sound and no graphic
>accelerators.

Excuse me for asking, but how old are you!!

Even the humble Speccy had sound, and so did the Atari 8-bits and they even had the choice of using 16-bit sound.

The PC has to flexible for the number of graphics cards it has to put up with.

The Amiga/Atari were designed graphically, memory movement wise. I'm not to digress into how the Amiga came to be, just look at the 8-bit Atari disk architecture and then have a look at the Amiga's!

The last I heard about the Amiga's, is that there is suppose to be a new machine. I suppose it'll be a little like the TOS clones.

> This is another
>reason why UAE is so slow. The ST was less dependent on the chipset so it
>has made better transition to being a viable emulator candidate.

I think the only reason that is because with a fast processor things CAN run quicker. I tried Tosbox on a friends PC last Friday and everything I tried to run didn't! I suppose that's what you get running a concrete block on marbles.

<snip Magic Mac)

>Finally, I really think that it would be a good idea if a few of the ST
>emulator guys got together and wrote the perfect emulator :-)

A good idea, especially if the Gemulator persons got in on it and brought the price down to a reasonable level.

>Iï¿½d love there to be a quick emulator aimed at apps which would use the
>Windows GUI for VDI functions (running only under DOS would be a mistake
>since you'd be limited to a very generic machine)

Why would it be, Windows is ONLY an operating system. DOS is extremely stable, and then there's LINUX, that's been having a lot of media attention over the last few weeks.

You never mentioned one of the points the Atari has over the other machines! The MIDI interface comes as STANDARD.

You don't have to buy one that works when it wants on the PC, and who's timing couldn't be used to boil an egg. Of course a decent card would cost more than a reasonably priced second hand Atari.

I have quite a lot of contact with Atarian's, who are also PC owners, and they usually have a comment or two regarding the PC and MIDI.

First and foremost is the reliability, and then there's the MIDI timing. Reliability mixed with MIDI at a reasonable price is something that's going to be hard to match.

I expect the arguments to go on, I would be very disappointed if they didn't. You wouldn't get very far if everyone agreed.

Just as a matter of interest the machines I use on a daily basis are:

Atari
Mega STE (fitted with an Ethernet card soon), a Lighthouse tower STE, a
Desktopper STE, Portfolio (2 used).

PC
Cyrix MII 333 MX and Cyrix PR233 MX based machines.

Steve Stupple <Steve@atari.org> wrote:
: On Sun, 18 Jul 1999 at 09:28:53 a message from Pera Putnik was created
: on the subject of Epson Drucker Hilfe.

I do own an Epson printer programming manual. It does not exactly
cover that printer, because a manual with the latest printer in it
is treated as a whole new manual, and in effect one page costs $80 US.

But, the only differnce between an old Epson pin printer, an old Epson
ink jet printer, and a new Epson ink jet printer, is that the new Epson
takes a "set small dot" command. I suspect on no precise information,
that this printer does not take a "set even smaller dot" command for
more resolution, but uses better software dithering.

That being said, and this being piracy (Oh horrors!)

The ESC/P2 command to control dot size is, in Hex

1B 28 65 02 00 n1 n2

Where, in my manual:

n1 = 00 reserved for future use
n2 = 00 default dot size (standard dot size)
= 01 selects small dot size
= 02 selects standard dot size

My point is that with Epson printers, any driver works. If you need color,
any color driver should work. I have dumped mono graphics output for a
nine-pin Epson to my 48-ink-jet-head Epson Stylus Color 600, and it came
out fine. I do that pretty often, printing from WordPlus to my Epson 600.
Have not tried color from a pin printer driver yet.

The only difference was in page length. The old pin-printer Epsons had a
page length of 66 lines. The new Epsons cut off at 61 lines.

Other than that, newer printers are usually cheaper processor chips and
different software, things that do not show from outside, and fewer user
buttons, because buttons cost money.

I have a good German-English dictionary, and will use it if pressed.

I have many rare vintage computer titles to trade: Ultima's, Infocoms, old EA stuff, RPG's, adventure games, etc. Many platforms are covered: IBM, C64, Amiga, Apple II, Atari. For a look at what I have, check here:

http://ccwf.cc.utexas.edu/~bilstein/atari2600nexus/trade/nexus_sales.html

I am interested in trading for Atari 2600 and Vectrex items ONLY! Please see my want list here:

http://ccwf.cc.utexas.edu/~bilstein/atari2600nexus/trade/wantlist.html

Also, if you have any items I am looking for, and I don't have what you want, I do take requests for game searches. I have some great sources, so I may be able to turn up what you want. I do not do this for sales, sorry.

Thanks for looking, Alex.

:it sound so promising) he said he did it himself with his own
:monitor.....but suggested i take my computer down to a Good tv repair
:shop and have them do it........i'm not to worried about doing it
:myself.....and haven't worked up the nerve to take the monitor apart and
:find these "PODS", i just want to confirm if this is true........

yes, it is true. I can confirm this! :-)
I have done it with my SM124.
take off the back of the monitor. there you will find a board with
some adjustable (with a slot screwdriver) 'screws'. these are
labelled. but there is also an adjustmant to be made to another part.
look for VEZZ's site
(http://www.geocities.com/SiliconValley/Way/8016/atari/atarist.htm
, I think), or check out Hallvards(http://launchpad.atari.org)
to find out more info.

:other question involves the mouse i have.....it's an
:original.........and it's not very nice....it looks to be in great
:shape....the ball and rolling wheel mechanisms work fine besides the
:moving parts in there could use some graphite or something to get em
:rolling smoothly.....but the buttons are just HORRIBLE!!!! So i guess
:i'd just like to know if i can get a nice quality mouse for
:it.........something made for the atari or some means of hooking up say
:a pc mouse......definetly after a mouse i'm looking into a
:hardrive.........all in all i'm happy though.......haven't experimented
:much yet but will very soon........thank you...am in the us if anyones
:wondering or wanting to give me a sales pitch........no problems there
::)
:-christian

well, checkout Mario's (Mario Becroft) site, i think at
http://www.pl.net/~mario/ he has a Serial Mouse Cable, which I use,
and distribute in N.A.
It is a great product. You plug in one end to your Atari Mouse Port
(not your serial port), and into the other end you can plug a PC
serial device (PC 2 or 3 button mouse), Glidepoint, tablet,
trackball,... also works for Amiga as well, not that you have an
Amiga. :-)
good luck.bonne chance

ken
p.s. hope you get that cubase 'platinum' problem solved!

Here are some serious problems with my ATARI FALCON, I can not use it at the moment!!!!

I have used AHDI on my FALCON with Quantum Lightning HD, but now I have bought HD Driver. I have done something which messed up my computer, I don't know what I have done wrong. When I turn on my computer with the HDDriver floppy disc as boot disc (without the hardisc on or off) two bombs shows up and and noise-picture in about one second and it will not find my HD.

When I'm opening up a program the message "Ata on the disc C: may be damaged" shows up, what can I do about this

When I' going to clean up in my computer, is there more than the AUTO-folder and CPX's whoch is important?, When I was booting from the hardisc earlier, I had AHDI as the driver, but AHDI.PRG didn't show up in the AUTO-folder, is there someting more to move than the AHDI.PRG?,

what about the "shdriver", shall I still have it if I'm using HDDRIVER?

It's entirely possible that it could be ported over. The only problem is that, because of the nature of the data, they do not release the source to anyone. All of the ports are done by them, So if they decide that an Atari port is worth doing (and they might very well decide against it), THEY would be the ones to do it.

As I see it, the problem is not the port itself, but the computation. As I said before it takes this spiffy new PentiumII 366MHz machine 18.5 hours to complete the analysis of a block data... I shudder to think what it would take on a stock ST. Of course, as we all know, the true joy of a thing is not usually in doing it fast, but in doing it well.

My best recommendation is that anyone interested in getting an ST port of SETI@home email the SETI team (best bet is to email them from their web page) and ask about the possibility.

We're starting to get people joining up with Team Atari now. Hope to see more of you soon!

No argument there, Chris. It would be the coolest thing in the world to be able to say that it was an Atari that found the first possibly non natural signal from 'out there'.... well, that would be the SECOND coolest thing. The first would have to be being able to say "MY Atari computer found it". <grin>

I'm all for petitioning the project for an Atari port, I just don't know of how much use it would be. There are several ports for Unix and Linux already, so they would probably be able to port it over in fairly short order.. if they have the manpower to get it done.
I'd just like to mention that, above and beyond the import of the project itself, the idea of linking computers over the internet to form what is basically one 'virtual super computer' opens up a whole new realm of computing options.

It looks like that old chinese curse has been placed squarely upon our shoulders:

(I posted about a couple of hours ago about a problem with my old Toad 50MB drive...)

I downloaded the IDC drivers from funet, and everything came back to me. I do have another question, though-- I have an internal SCSI jaz drive lying about that I'm not using. The Toad drive has space for two bays, one of which is the 50MB. Can I add the jaz drive in there and have the computer recognize it? Will I run into any problems? I have a 1040ST.

Henk Robbers wrote:

> No wonder that it is most widely spread among the most gullible of computer users.

To be fair to the project, when you operate on a limited budget and need results you don't normally skip over the options most likely to make your task possible....

If you're going to buy a car, you don't bring a bag of pennies with you.

Even if the project's resources were large (which they're not), it simply wouldn't make sense to put the time and effort into designing the software to run on what is for all intents and purposes an orphan platform... at least to start with.

Results are what count in any scientific endeavor, whether or not they are the results you hope for (in this case, finding an artificial signal), you need to take your best options at getting results.

If I remember correctly, the project wasn't even supposed to be up and running until January, 2000. So now that they're off to a good, solid start, perhaps they would consider an Atari port. From what I hear, they have an Amiga version in the works now. Perhaps we will see an Atari version after all.

My concern though, is not with getting the program ported over to the ST, but how well it would run on the average Atari system.

Send email to setiathome@ssl.berkeley.edu and ask about the possibility of an Atari version... I already have, but haven't gotten a reply yet.

See ya,

Source record: 75819

I recently pulled my 1040ST out of the attic and am trying to hookup my old TOAD Computers 50MB harddrive to it. However, I cannot remember how exactly I can see it. I tried just adding a new drive 'C', but it doesn't work. I have disk B of the ICD host software that came with it, and while it has utilities that recognize the drive and test it (and it passes), there doesn't appear to be any 'drivers' or anything, or formatting / partitioning utils.

Any ideas?

----snip----

Steve,

I could not use WDIALOG in my auto folder or the desktop in order to configure.
I solved the problem by using the Auto Run feature in XBOOT without any
problems. Once all is configured and saved I then remove WDIALOG as it does
cause problems with some of my other programs.

The polydisk or megadisk carts are useless on falcons or TT's
so I've been told by someone who has one. Apparently the driver
is very poorly written. I've seen one many years ago, it was gray
and slanted on top to somewhat match the slope of the keyboard on
a 520st if my memory is correct.

Source record: 75884

Atari ST 540 Computer Package

One of the best computers to come out of the '80s

I purchased this system about 6 months ago hoping I'd get some good use out of it... I didn't. 8*) It had a broken 3.5" disk drive which was swapped for another working 3.5" drive (same model number as the Falcon drive), works perfectly. Here are the stats on it:

Atari ST 540 Unit w/ built in 3.5" floppy drive
Cover is not screwed on, the disk drive is smaller than the standard one, so the cover must be removed to allow access to the disk drive
SC 1224 Color Monitor
Star NX-1000 color dot-matrix printer
Could use new ribbon cartridges, but ones with it do work
Atari ST Mouse
Atari Standard Joystick (works with ST and 2600)
Software
Includes Printmaster, Thunder, DEGAS, Winter Games, SkyFox, Arkanoid, Mixed up Mother Goose, and many others
All Connection Cables

Asking price: $50.
Shipping: I'd REALLY prefer not to ship this. It's REALLY heavy and would cost an arm and a leg. If you insist on it being shipped, I charge $30, if it costs less I'll send back whatever money is left, if it's more, I'll pay the difference (can't beat that with a stick). So the total price would be $80, which is still a pretty good deal. I'll ship it UPS, ground. If you're interested LMK by e-mailing me, thanks.

Source record: 75889

Hello,

A couple of weeks ago, some French ppl started having trouble to connect
to the Belgian FTP site. Even to all hosts of the domain rma.ac.be
I was wondering if other people had the same problem. Taking a look at
the log-files of the server, I'm certain there are.

I you would have had the same problem, and still have, coul you drop me
a line and give me an answer on these questions :

What TCP-IP packet do you use : Sting / Mintnet / NOS / ...?

Can you access ftp://tezcatlipoca.rma.ac.be/

Can you access http://www.belnet.be/

Are there other ppl you know and have the same ISP as you, who don't use
an Atari, that have also these problems?

Thanks for your help.

I have 2 options from my IP. The IP recommend a EICON Diva T/A with 2 analog ports for connecting phones an 1 port for the computer or a Lasat T/A. The person I spoke to stated that the EICON was the most stable?
According to the tech/spec page on www.eicon.com it support connection from 56 kbsec and up.

BTW. I did try to increase the port speed in I-Conn to 115200, but with the modem I use for the moment, I actually get a slower connection. With the port at 57600 I usually get from 28000 up to sometime 35000 bytes/sec downstream with CAB.

FIFI normally give me around 25000 a sec.

I'd like to add my voice to this...if it is possible to do it I would consider majking such a thing via ASP....SIMM's are very cheap these days so it would be a trivial thing to provide a reset-proof though not non-volatile RAM cart of about 16Mb or so, I guess it's access speed would make it a lot faster than HD and a big help to programmers etc...

Until these apps are fixed you could install a MiNT-cookie with a
version-number that reflects the capabilities of MagiC and your
socket-device. This may fool some apps, although incompatibilites between
MiNT and MagiC and missing features in MagiC probably will cause a lot of
problems.

> others I've tried, just to begin debuging. I beleive that from now on
> MintNet authors will check for u:/dev/socket only ;-) Fortunately

I don't think so, as you normally don't use this device at all. It's used
by the socket-library, which should be updated to support your
MagiC-device (I guess it currently checks for the presence of MiNT).

Btw. the socket-device will be moved into the kernel in the future, and
libsock into MiNTlibs. I suggest you subscribe to the MiNT-list to discuss
any changes that has to be done to MiNTlibs to support your device.

> Btw, what is wrong with Olivier's CAB.OVL ?

I don't know, I've never used it. But does it support SSL?

Btw. a socket-device alone wouldn't be enough to run many unix-ports (and
native MiNT-apps) under MagiC, as MiNT and MagiC still differs in many
ways.

I was thinking of that, mainly for aFTP since there is a STiK version that
works with MagiC, if I run the MintNet version with a MiNT cookie, I hope
it will use MagiC's sockets. Time to port my FTP Server to MintNet ;-)

>MiNT and MagiC and missing features in MagiC probably will cause a lot of
>problems.
>
Well, the goal is to iron out these incompatibilities. I'm the last to
take part in discussions like "which is the better OS", since the better
OS is the one that does anyone's job better (in her/his opinion ;-),
even if it is the Spectrum OS.

>> others I've tried, just to begin debuging. I beleive that from now on

Wrong guess ;-) It doesn't check for MiNT, and yes, I've ported sock.lib
to Pure_C and MagiC. I've used it for porting all the tools (ie route,
slattach, ifconfig, arp etc) and some of the examples. They all work fine
under MagiC and so they do under MintNet. Binary compatible! I wonder why
it's not the other way around, ie the same tools compiled with GNU C in
MiNT, are NOT working in MagiC. I suspect some init library, but I'm not
sure yet.

>Btw. the socket-device will be moved into the kernel in the future, and
>libsock into MiNTlibs.
>
This is bad news ;-(You mean that from now on, every change to the
sockets driver will require recompiling the MiNT kernel ?! But I thought
that an XDD (or DEV under MagiC) _is_ part of the kernel, since it's hooked
deep into it, which is the reason to make it Linux like ?

> I suggest you subscribe to the MiNT-list to discuss
>any changes that has to be done to MiNTlibs to support your device.
>
That is a good idea, although 'my device' tries to be as compatible as
possible (completely compatible for the end user or the author that uses
sock.lib). Incompatibilities between MiNT and MagiC though is another
cup of tea ;-)
Any person I have to contact for subscribing me or just the usual
'subscribe' ?

>> Btw, what is wrong with Olivier's CAB.OVL ?

>
For the moment I'm interested in the sockets part, at this level NFS,
other protocols, (ethernet) drivers etc can be persuated (!) to work
fine under MagiC and my first tests are encouraging. MagiC has enough
limitations in signals handling, D&D, Fopen modes and handle inheritance
but there are workarounds for most of them. From V6.10 it started to
support more Unix feautures, so we might see better days.

Yeah - I never liked them either but they were actually the idea of a chap called 'Ben Taylor' who was one of the joint editors back then. Thank heavens they were dumped when the mag split into Amiga Format and ST Format!

To be honest, the worst part of being on ST/Amiga Format was having to master the dual format floppy disc each month. The dual format was developed by Rob Northern Computing and it very rarely worked first time. We usually had to make the disk up about four times before we'd get a disk that worked properly on both the Amiga and the ST!

BobKing <robert.king@patent.gov.uk> wrote in message news:37930F23.D31A271F@patent.gov.uk...

Probably because you're using a distribution without 'dir'... On my setup
'dir' is just an alias for 'ls'.

> - is there any way to have access to the Atari filesystem while running
> Linux?

I have very little experience with Linux on Atari, so I really can't say
for sure. But TOSFS is (almost) compatible with DOS, so try to mount them
as DOS/FAT-partitions. MinixFS is supported, and MiNT supports ext2fs so
you have plenty of options :-)

> (BTW, why is it that some files are completely different named in Mint
> than in Linux?)

Different distributions. There are similar differences between
Linux-distributions, like Redhat and Slackware.

> configs that I overlooked. I get no output on the screen after "pon", so
> I'm just wildguessing what's happening. Under Mintnet, I saw a lot of

pppd (if that's what you're using) sends all messages through /dev/log
(IIRC), so you need to configure syslogd (if Debian use this, I really
don't know...) to redirect the output to the console. It should also be in
a log-file somewhere.

Hey Ron,

dunno... somehow I recall that when I was firsttime in Mint-unix, I
somewhere issued a "dir" command (I have been Dossing around, you know?)
and all it said was "unknown command". Which in turn I found a logical
explanation. So use "ls", dumbo...
Now this morning I was fooling around in Linux again, checked the /bin dir
and found a "dir" somewhere. So just for the fun I issued a "dir" cmd, and
it came up with a listing. Next I tried "ls", well, same listing. I know I
can use switches on "ls", like -a or -l or combined, but I was mainly
thinking at "why doesn't "dir" work in Mint-unix and does work in Linux?"
>

Yup, glad I bought this Unix Unleashed. The CD-ROM has both parts, incl.
the VI (and Emacs) chapters. The CD-ROM has another big Linux html,
including a chapter on VI.

First time huh? You wanna know *exactly*?

-Was reading Kellis' info text "VI is tricky"

-Had to edit some files

-Called VI with filename, I think it was /.chat-script

-got the file in front of me. Next: how-da-heck do I edit this one? After
somany keystrokes, by sheer accident I managed to get it
inserting/deleting text and managed to get the file to what it should be.

-next is: save and quit... HOW? I tried about every key or combo I knew of... No way.... Couldn't exit either... I jumped ship with CTL-ALT-Del!

-Next called VI with --help or something, found a few keystrokes to exit and save/exit. Wowie!

-called VI again with chatscript. *THIS* time I knew there was a command mode, an insert mode and another one. So, after a short time I managed to get the editing done. Next step: hit ESC, zz and that should be it. Problem was that VI answered "command not supported in ....shell"... Another jump-ship with CTL-ALT-Del...

-I finally transferred Pico to /bin, made it an executable one and did the next edits with Pico...

Rite *now* VI won't fool me again. Works flawless under Linux. Compared to QED/whatever? Yechh! (and another big grin... I know it HAS potential!)

Another problem is that the current (released) MiNTlib probably doesn't know that MagiC supports this... Christian Felsch is working on improved MagiC-support in MiNTlib.

> I was thinking of that, mainly for aFTP since there is a STiK version that

Guido Flohr (IIRC) has written a small program called FakeMiNT that installs a MiNT-cookie, you can find it on his homepage.

> it's not the other way around, ie the same tools compiled with GNU C in
> MiNT, are NOT working in MagiC. I suspect some init library, but I'm not

Gcc behaves identically under MiNT and TOS/MagiC, so there must be some differences in your libraries.

> This is bad news ;-(You mean that from now on, every change to the
> sockets driver will require recompiling the MiNT kernel ?! But I thought

Not from now on, but sometime in the not-so-distant future.

> that an XDD (or DEV under MagiC) _is_ part of the kernel, since it's hooked
> deep into it, which is the reason to make it Linux like ?

So did I, but the gurus claim that having the sockets in the kernel has some advantages. Compiling isn't a problem, we're all using 'make' ;-)

> That is a good idea, although 'my device' tries to be as compatible as
> possible (completely compatible for the end user or the author that uses
> sock.lib). Incompatibilities between MiNT and MagiC though is another
> cup of tea ;-)

A healthy discussion about MiNT- and MagiC-compatibility is needed, so please join :-) It would have been nice if Andreas Kromke (are you reading??) would join as well.

> Any person I have to contact for subscribing me or just the usual
> 'subscribe' ?

Just send a normal subscribe-mail to mint-request@fishpool.com

> but there are workarounds for most of them. From V6.10 it started to
> support more Unix feautures, so we might see better days.

Yes, it would be nice if MagiC could things like NFS, Samba, ssh etc. as I
feel very isolated with the current options ;-) It also need a proper
terminal-emulator, but MagiC does not (AFAIK) have ptys yet, so porting
TosWin2 is rather difficult.

This can happen if access to RAM is faulty. You could try going inside and re-seating all socketed chips/SIMMs. Brush out ant garbage which may be causing shorts while you are there.

>
This is problem nr. 2 to solve: as long as I can't access Atari's FS from
Linux or get to Linux partitions from TOS/Magic, there's nothing I can do.
I've settled with VI now, no probs. But the next problem is how to get
XF86 or X11 onto the system. As long as I can't ftp with ppp under Linux,
I see no way to get anything into the Linux partition. And as long as it's
outside, I can't use it :-((
Well, I mite give it a try running Mint/Minix, see if I can access the LNX
partition... that would be the day! :-)

> Regards Rusty

The most probable cause is oxides on contact surfaces, either on the SIMMs or their sockets - or the same problem with other chips. The best way to fix it would be to get yourself a fibre-glass pen and brush off all pins and sockets the oxides - BE CAREFUL since if you handle it too roughly, you might damage the sockets or the chips and make it worse...

You have MiNTnet up and running, right? Then download the ext2fs.xfs from
Frank's web-archive, put it in c:\mint (or c:\multitos) and you'll have
full access to your Linux-partitions from MiNT. Just remember to set the
partition-type on the ext2-partition to the right value, this is mentioned
in the README for ext2.xfs.

Hi, I just checked again... dir does work, like ls. Difference is that
with one cmd I get files with an asterisk, the other doesn't show these.
The confusion must have started when I "dossed" around using a cp cmd
where DOS returned an error message.
>
>> configs that I overlooked. I get no output on the screen after "pon", so

>a log-file somewhere.

Checked the /var/log/ppplog this time:

up till the pppd lines all seems to be OK (chat reporting "serial
connection established", so my login seems to work OK)
Next are:
pppd: using interface ppp0
pppd: connect: ppp0 <--> /dev/ttyS1
pppd: cannot determine ethernet adrdress for proxy AR
pppd: local IP address ....
pppd: remote IP address ....
(these two show the right stuff)
pppd: terminating on signal 15
pppd: connection terminated
pppd: hangup (SIGHUP)
pppd: exit

BTW: meanwhile, I tried running Mint/minix, but no access to the LNX
stuff... (was afraid of that already)

Didn't you notice that WenSuite uses a compression algorithm which is not very lucky when displaying pictures ? This can explain the speed but also the display quality which is really poor;
If you look closer at your displayed pictures, you will see a lot of details missing ! This never happend with Cab or any other browser ... even text lines can become very difficult to read while attempting to read smallest characters ... because details are missing ... that's one of the biggest faults for WS.

It is my understanding that, because of the nature of the program, they are not releasing the source. I may well be wrong about that, but it makes sense to me. The calculations are of paramount importance, and _I_ wouldn't want to have to worry about anyone messing with the algorithms, so I'm assuming the same about them.

Dual 060's... THAT'S the ticket! <g>
That'd be one heck of a machine. Does software need to be written specifically to take advantage of the dual processors like on that other platform?

At any rate, it's worth emailing the project managers to see if it's possible to get an Atari version.

Take care,

Joe Mirando

It turns out that the machine is only a 2000. I popped it open. Looks like a CSA 040 card is installed with 32mb of fast ram. It has a SCSI card by Commodore. The Toaster sits on the far right of the machine. I have no idea which version it is. There are two time-base cards (i am told) as well. Two floppys, a maxtor HD. It has a video toaster sticker attached on the left side of the front case.
And I thought Ataris were weird :).

Message-ID: <7n0ddusdb2@news1.xs4all.nl>
Source record: 75772

Hi,
Well let's give Wensuite 3.12 the benefit of the doubt.I played with 2.40b many times.It's intriguing how you can login(sometimes) and not login (sometimes).When you succeeded in inlogging, you notice the speed, it's fast, faster than Cab, which is very good, but very slow on my TT030. We Atarians do need a fast browser and I think Wensuite can be the one, let's all support this product.It's a pity Cab won't updated anymore.I don't know why, it only has to work faster, I have no more desires only more speed.Is that so difficult ?
Jos
My list of desire : A fast browser
A large amount of STRAM in my TT030
A Pentium emulator in my TT030
Cubase working under MagiC/Jinnee
Sweet 16 sequencer gets a major update!
Cheap CD write software

2065. Web Browsers

Newsgroup: comp.sys.atari.st
Date: 1999-07-19 00:00:00 UTC
From: Don Schoengarth <dons@qnet.com>
Message-ID: <3793D6E4.564A239D@qnet.com>
Source record: 75773

In the last 3 days I have managed to try all the Atari Web Browsers(ie. Wensuite,CAB, and Draconis). All have seem to come along way from their original state. Know if I could only get all of them to work or just even dialup with the software that was supplied with the package. I have been trying all of the web browsers on my TT030 w/3.05 and 4meg TT ,2meg ST and US Robotics 28.9 modem.

So far I have only gotten Draconis(demo) to work everytime. Yes, it is a bit slow I dont know if is due to the 28.8 modem or the software. This package was by far the easiest to setup, it pretty much does everything for you. Where as a CAB(demo) is just a pain in the butt. Wensuite(demo) seems to be a nice program if I could only stop getting bombs. I have also tried out STiNG and would like to say this dialer is great now if I could just get CAB to work correctly.

Oh yeah the most important part of this is that I DID NOT read any directions,FAQ, or any help files when setting all the packages up. Yes, I know RTFM. I wanted to see how far I could get with all of the packages and the result is only one of them is very easy without instructions to setup. Maybe now I will go back and RTFM. Im going to also try the email,FTP and other stuff that is found with some of the packages again with out reading anything. When programmers make such a package of utilities they should take into consideration that some of us dont or wont read the manual before truing to install their software. I truly believe the easier the install the more likely someone will use a product.

Well enough of my rambling Im off to play with more software.

Don Schoengarth

Swap the shifter first with a known working one. Heck, just reseat the
one in there before you even do that. Strange but true- it works.

Eric

> the Unix stuff running. The experiences from Mint/Mintnet came in handy.
sure does. Helped me to work on some SUN Ultra 1 workstation with solaris
on it, and same for HP-UX. MiNT is good knowledge in a long term.

> (BTW, why is it that in Mint-Unix "dir" doesn't work and in Linux-Unix it
> does? What's the difference with "ls"?)
dir afaik is only a shortcut, not a real command.
If you want dir to work in mint, do the same as under the linux.
alias dir='ls -la' whatever binding you wish.
some installation come with different default files, that's all.
Same goes with ll being a binding for ls -la on some machines. Very
personal, and at this point it is more customization than anything else.

> Next, the important questions:
> - is there any way to have access to the Atari filesystem while running
> Linux?
linux should be able to access all your FAT partition, and minix
partitions you had under MiNT.
More over. It should read natively your ext2fs partition (if you had one
in MiNT, latest versions). I think they are compatible.

> the dns number on it. Something like the same file in Mint.
> (BTW, why is it that some files are completely different named in Mint
> than in Linux?)
Attention, MiNT is NOT linux, and Linux is NOT unix, and Linux is not
NetBSD, freeBSD and not Solaris, and NOT HP-UX. etc etc.
All these OS are unix flavors, they will have differences. Actually MiNT
is closer to Sunos&BSD than linux. but well. Hard to say exactly :) They
are all very different and close at the same time.

> I'm just wildguessing what's happening. Under Mintnet, I saw a lot of
> messages flashing across the screen.
because by default your syslog got redirected to the console (direct
screen) on MiNT kgmd. This is to help you debug your machine, tune it uyp
right. Then you can redirect it to null, or a log file. Up to you .
Up to you to mess with your syslog.conf file.

> Now this Linux is nice (maybe), but I'd like a GUI. Guess that would be

Read above, cross compatibility as far as the file access should not be
any problem at all. You only need to know how to use the "mount" command.

As far as the GUI, good luck running that on your atari. It will work, but
not very enjoyable experience, I can tell you that.

Getting linux up is not that hard, the problem is what you can do with it
efficiently. All the "interesting" programs out for linux won't run on
your machine, and if they do, will be HELL slow.

vi ain't that bad once you understand the basics of it, however not very
recommended for simple editing on local machine. Get a simpler editor
maybe, like pico, ee, and some others.
And "no" to answer your question about binary compatibility.
A linux prog even for 68k will not run on MiNT, or TOS or magic. Will only
work in linux68k OS.
Hope clears some things up.

Btw, personal opinion, after using Solaris (work everyday), HP-UX and
Linux (i386), I can tell you that MiNT is extremely efficient, fast and
really lovely to use. (that's just me though)

```
-----------------------------------------
/
MiNT Is Now TOS, let's move on, shall we? /

> And I do use HS-modem,- DERVIN and SCC programs.

Outgoing always seems better for some reason. Strange! I tend to
use the RS-422 LAN port for null-modem now, because I seem to get
better incoming with that than I do with the RS-232, but it still
isn't very fast going...only stuff going OUT of my Falcon is fast.

I used HS-modem 7 and Connect 2.46 running under MagiC 4 to achieve
all of the above.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> 115200 does not work properly with TOS, and since I don't have a
> 030-Falcon anymore I don't know how the new MiNT-versions copes.

I have tested null-modem at 230400 outgoing and it works well on both my LAN and RS232 ports (1 meg from Falcon to a Mac in 35 sec), but the incoming is error ridden at 230400 to the point that dropping the port to 115200 is faster. Even then I get some errors but not enough to be slower than my fastest error free rate (57600). I run a Falcon with a 32MHz CPU accelerator (PowerUp2) and MagiC 4/ HS-modem. I can never get the same performance under TOS even with HS-modem. MiNT I have not tested with this test...

Also, the only ISDN in Christchurch is around the central business district and costs an arm and leg... ;^(

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>
> i use the atari for midi and the mac for audio but would love to be able
> just to access the harddrives of both comps....

You can't do this right now with just STinG because there is no NFS
compliant client around yet, but you can use FTP. You could do this with
MiNT, but that might be a bit overkill for just transferring a few
files.

Doing it on the PC will not reduce the number of disks.

What kinds of disks are these 200 disks ? If they are games, then you
actually have to convert them to a disk image format and use them with
an emulator. Check out the Quick FAQ.

Yes the easy way is to run tosdump.prg on the ST and copy the file over
to a disk. What's the hassle with that ? You can also get TOS rom images
on the net too, but it's illegal.

Hi ,
Yesterday I received an email about stocks and how to buy them and how to multiply them.So I'm not interested in stock at all, only Atari, music, saxophones and inline-skating,but I was curious so I downloaded this email.I read it and I deleted it.
Yesterday evening I opened my emailbox again (MyMail) and there were 3 mails waiting for me, again the 'stockemail'.I downloaded everything and wanted to look, what's been sended to me.But then I saw the the contents of my mailbox was multiplied (without names) and my C partition was corrupted, the FAT was corrupted (I'm not sure about that , cause I could reset again but.....my Jinnee desktop was disappeared, in fact all my Jinnee files and folders were vanished.....Lucky me, I had a recent backup on F Partition, so I could initialise C (with HDDRIVER) and put everything back from F to C.I wonder if any of you had the same experience.......
Jos

2085. FS Very first 8 issues of Amiga & Atari Format

Newsgroup: comp.sys.atari.st
Date: 1999-07-19 00:00:00 UTC
From: BobKing <robert.king@patent.gov.uk>
Message-ID: <3792FD1F.B82B5689@patent.gov.uk>
Source record: 75836

I have the first 8 issues of Amiga & Atari Format (could be round the other way), ie before the publishers split it up to separate mags. Amusing cartoons featuring 'Amiga and Atari 'superheros', beating up on each other, but some good serious construction stuff including a board for tapping to ST's three sound chip outputs to make pseudo stereo. There were no disks in those days.

A bit of Atari history?

Sorry no splitting, ï¿½8.00 incl. PP.

Talking about Atari history, Atari put the complete construction (at black box level) of their 400/800 8 bit series in a Patent Spec. If any one is interested, I'll ferret out the number. I can't find anything for the Falcon series.

Bob-King.

2086. Questions again!

Newsgroup: comp.sys.atari.st
Date: 1999-07-19 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <3792f77c7f7c10@holleman.demon.nl>
Source record: 75837

Hi,

summer vacation! Wowie zowie, lotsa time to experiment again.

This time I set up Linux... and got it working. Basically that is, just the Unix stuff running. The experiences from Mint/Mintnet came in handy. Meanwhile I bought the Unix Bible incl. CD-ROM, which has lotsa HTML files on Unix and Linux. Not to say: an overload right now. Once again I can't distinguish the trees from the rainforest...

I used the debian release, got kernel 2.0.33 running.

(BTW, why is it that in Mint-Unix "dir" doesn't work and in Linux-Unix it does? What's the difference with "ls"?)

Next, the important questions:
- is there any way to have access to the Atari filesystem while running Linux?
- I've configured some files to get Internet access: /etc/ppp/peers/provider and /etc/chatscripts/provider. Also created a file /etc/resolv.conf with firstline demon.nl (my ISP) and second line the dns number on it. Something like the same file in Mint.
(BTW, why is it that some files are completely different named in Mint than in Linux?)

So far, I am able to use pon and poff, the connection starts and stops with that, but after the login nothing happens. I see the modem lites flash for a while, then nothing. Typing in "ftp ftp.funet.fi" returns a "unable to lookup hostname" or something. Probably something in the configs that I overlooked. I get no output on the screen after "pon", so I'm just wildguessing what's happening. Under Mintnet, I saw a lot of messages flashing across the screen.

Now this Linux is nice (maybe), but I'd like a GUI. Guess that would be X11. I found a list in the tons of docs what files I need for that. Next will be finding them, then getting them onto my system. That would mean they'll go somewhere on the Atari system. Next is: how to install them onto the Linux system. I don't see a way that Linux reads my Atari stuff and the other way around: the LNX and SWP partitions aren't seen by TOS, MagiC. Does it mean I need to fetch the files running Linux? First need a decent Internet link... see previous.

Anyway, working with VI is tricky indeed (Kellis, you reading?). But slowly I'm coming to grips with it. Since there is no way of copying Pico from my Mint stuff to the Linux stuff (would it be compatible, anyway?) I'm stuck to VI.

And for now, I got stuck with Linux too... (well, it's running at least)

You need to get a replacement mouse from an Atari dealer, such as Titan
or Systems Solutions, or a PC mouse adapter, or a serial driver. This is
all described in the Quick FAQ.

> Email me at dg73@dial.pipex.nospam.com (remove '.nospam' for email to work)

No I won't.

There's no way an email virus could have infected your Atari.

Email virii generally use .doc or .exe attachments. You have to
voluntarily go and run the attachment for it to do anything. I guess
embedded Java/JavaScript or ActiveX might be able to do some damage, but
we are still free from that.

>
Ooops, now you've got me ;-) How can can I repost a message from Okami?

Anyway, I've written a small tool that _helps_ in RSC translations
and it does it like this:
It produces a TXT file containing all the text fields from objects,
alerts and free strings of the original, by dragging the RSC to the GTP.
You can pass this TXT file from Ruftrade, Gemtrade or any other
translator utility, producing an ENG or RUF file.
The translated file should be thrown again to the GTP and it will load
and modify the original RSC, thus producing a translated version.

The program will take care of text fields length, so translated lines
longer than the original will be clipped but this way you can be sure
that the original will not be destroyed (but a backup is a good idea :-)

Both the original and translated ascii files can be loaded side by side
in any text editor and make any changes/corrections using normal text
editor feautures (ie search and replace etc).

Keeping the TXT and ENG or RUF files will make future updates of the
same program much easier to translate since normally it will contain
some more menu entries or new options in some of its forms.

Up to now I've found it quite fast for translating RSCs, eg jinnee 2.01
took me about an hour (jinnee.rsc and jinnee2.rsc) to produce a descent
translation (no more hitting 100 times the 'Abbruch' buttons in the RSC
editor to change it to 'Cancel' :-)

I was wondering if we have such a utility, in case we don't, I'll put
it in my homepage and anyone can try it.

From: french-lines@usa.net
Message-ID: <7n1rjeqss1@nnrp1.deja.com>
Source record: 75697

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

french-lines@usa.net

Alternatively, anyone know if this SACK Electronic GmbH is still around ?

Well, I do live in the U.S.:). I also have a dual standard Aiwa VCR so
if I really need to convert to PAL, it isn't a big deal. It does it on
the fly so I can record PAL direct to tape with fairly high quality (I
won't be makeing any mini-series:). No software came with the machine
(yet). I haven't booted it, so I don't know what is installed.

The best (= most usable) monochrome bitmap/vector package I have seen on
any computer is Arabesque. OK, it's old, doesn't like
multi-tasking GEM version very much and has several other limitations, but
it still works like a charm, even on the Falcon. Arabesque Pro was given
away on an ST-Format coverdisk a few years back. Mail me if you want more
info...

Can I put in word for MegaPaint Pro. This is dual bitmap/vector. Its native format BLD is a bit limiting but it also accepts Degas and IMG. It has a CAD, rather than a sketch approach to things. As a bonus, it is able to directly scan in IMG files (like Calamus 1.09n). I agree with the other answers, Arabesque is a joy to use and Munch has so many hidden 'secrets' you never come to the end of its abilities. Da's Vector is bloated out with charting and animation sections of very little use and has the usual german limitation of native format.

e-mail me at rking@zetnet.co.uk for more info.

Source record: 75702

Hi Claes,

This fiberglass pen of which you speak.... where might I find such a magical device? Would my local Tandy/ Radio Shack have it? Would the fellows there even know what I was talking about?

My Falcon occasionally has vertical stripes on the monitor, which can be temporarily relieved by a (loving but firm) whack below the cursor keys. Sometimes the computer locks up. If I take it apart and pull out the (Wizztronics) memory card, and then pull out the 14-meg SIMM, and put it all back together again, it'll usually be fine. It certainly seems a bad contact. I have Nemesis, and sometimes if I run it at a slower speed the problem goes away, but last night it still locked up even when I slowed it all the way down to 8mhz.

Thanks for your helpful suggestions,

Clayton Murray
claytone@aa.net
Seattle, WA USA

Artworx can import WMF's and convert them to GEM or CVG. XChange can do the
older format WMF's but it hasn't been updated (AFAIK) to handle later
versions.

Did I said it's free ? :-) <big smile>

Well, of course it is and is dedicated to everyone that helped us with
translated software or documentation. Get it from my homepage now.

Btw: Since painting took more that I had expected(!) the program has no
user interface, only one alert, and this says 'Finished' if everything
is OK. If not it returns (-1). Other than that it works fine (?)
Please let me know of any bugs, additions you'd like etc.

Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://uvk.atari.org.
This message is being sent to four newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

erm no. I totally knackered my original STfm years ago when trying to
install an upgrade and this was a soldering iron job - good job System
Solutions where happy to do the upgrade (and repair!) for me :-}

No soldering iron anyways now :-)

I have bought HDDRIVER, after testing the demo, but when I tried to open HDDRIVER.PRG (I didn't have it in the AUTO folder) two bombs occures and a noisy picture showed up for two second. What is wrong? I have cleaned up the AUTO folder and the CPX, but nothing helps! Do someone have an idea how I can solve this problem!

Yann,

I would be willing to bet that the use of the DSP would place a FALCON030 version of SETI@home up among (or even beyond??) the versions written for some of the 'state of the art' computers that are now in use for this project.

Joe Mirando

ps By the way, I just looked, and Team Atari is up to 11 members already. Between the 11 of us, we have contributed 1658 hours of CPU time and analyzed 71 blocks of SETI data. I've just lost my "first place" rank to Tannoz, but that's fine with me! The more, the merrier!

Hi,
I have the instructions for PC-Speed, I just bought a Mega ST4
at a garage sale and it has a Pc-Speed board in it. I found some i
Installation instructions in a box of stuff with the mega. What I
don't have is the software to run the PC-speed board. I can scan
the instructions into my PC this weekend and send them to you.
Can you send me a copy of the software ?

Dennis,

Since we are using the same ISP and you havent had any problems with
CAB2.7 please tell me how long did it take you to setup your CAB 2.7 demo
before it worked correctly? If I remember correctly you had some problems
and I bet you read the manual. I setup Adams and Draconis in a matter of
minute (less than 5) with out reading the manual or anything. This Package
did almost everything for me. I did my selection of modem,ISP number, and
language. Please let us know how long it took you to setup CAB,CAB.OVL,
and STing.

Again people I am not saying that CAB is not a great program, it just takes
time to setup...

Subject: ResourceTextReplacer (RTR) 1.1
Maus-ID: A35648@L2
Message-ID: <199907172230.a35648@l2.maus.de>
Date: Sa, 17.07.99 22:30

Program name: ResourceTextReplacer (RTR)

Version: 1.1

Date: 16.07.1999

Type: Programming Tool

Status: Shareware-restricted

Pice: 20 DM

Author: Armin Diedering
Armin_Diedering@L2.maus.de
A.Diedering@t-online.de

Brief description:

ResourceTextReplacer (RTR) v1.1 from 16.7.1999
All texts from a Resource (Button texts, ...) can be exported to a ASCII file.
RTR is able to read such a file and replace all texts in a Resource.
RTR supports ResourceMaster-Multilayer-Resources (as of RSM v3.0 and v3.1)

Memory: 1 MB

Resolution: All

Improvements:
Some modifications to work together with RSM 3.1
... no, it is not available yet. RSM 3.1 is in beta-test.

New export format where only those texts are exported that really have to be translated.

New import format that is processed not sequentially but by a search&replace method.

Installation via GEM-Setup

Download:

I have CAB,CAB.OVL,STiK, and STinG. I didnt need the docs to tell me that. I
have read plenty of messages about people having trouble with CAB to know what
is needed.

Really then please tell me why it is that Adamas and Draconis pretty much set
itself up. All I did was select my modem,ISP+number,and language. Like I
said NO docs were read before I started with Adamas either.

Nick,

Everybody seems to be taking this personally. And its not a personal thing its
just my observations on the various web browser packages out for the Atari. I
have personally followed CAB since the start and have watched it progress is a
nice software package. Just wish I had never stopped programming so that I
could add to the package to make it alot more user freindly :)

I fully agree with you. I start out by tring to setup a program this if it doesnt do what it was designed for I start reading. In this case I have see so many messages in the newsgroup about CAB and Wensuite I pretty much knew what I needed and where to put it. I may go back and read the manual on the other web browsers but, Im think of purchasing Adamas and Draconis.

Source record: 75728

I'm having trouble getting a good joystick for my ST. I bought a Sega Genesis controller for $1.97, knowing that it works with my 2600 and Commodore SX64, but it made the mouse act funny. Then I tried two different Coleco Super Action Controllers (4-button with keypad), and while it works for some games (like Super Cycle), it acts jittery and bad with most others (I tried Goldrunner, Time Bandit)... and refuses to go left half the time.

I'm almost positive I used to use my Coleco Super Action controllers with my ST, which leads me to believe something could be broken now? If not, where can I get a good ST-compatible joystick? I need to play Bricklayer!

The mouse works fine, by the way.

2129. SC 1435 dies and screams ! Help.

Newsgroup: comp.sys.atari.st
Date: 1999-07-20 00:00:00 UTC
From: petersansom@my-deja.com
Message-ID: <7n0m79$es6$1@nnrp1.deja.com>
Source record: 75778

Hello fellow Atarians,

The other day my SC 1435 colour monitor died a nasty death.
One minute it was working fine, I left the room for a second,
came back , the monitor suddenly has no picture and is making
a high pitched whining , screaming sound ! So I turn off the
power , as I did so the high pitched sound lowered itself in
pitch , in a series of steps.

What I would like to know is -

Does this sound indicate a specific problem and if so what problem ?
Can this problem be fixed by either me or a repairer ?
Has this happended to anyone else ?

Any help would be truly wonderful

>Threading will probably be lost by the way.

Another way would be to find the message in "outbound.archive.[user]",
open it up and press ctrl-M to save it out as "C:\CLIPBRD\SCRAP.TXT".
For a proper repost save only the message body. Then find the article
the this was the reply to and reply to it again without selecting
"Quote". Then just paste the original contents back into the message
body and save.

You shouldn't really need to set it up if it was already working with
that same machine.

Are you sure that you switch on the drive first, a few seconds before
powering up the ST ?

Otherwise, well, you can download AHDI from
http://bales.online.fr/atari/files/

CAB needs a CAB.OVL file to interface with STinG. That's in the docs.

> product.

No they can't. In our Atari world, ressources are limited. Lots of
programs have been designed to only function if they are running with
some other specific software package (CAB+CAB.OVL+STING or STing+HSmodem
for example), just to save ressources. There's no way you can learn that
without reading the docs first.

On most systems both 'ls' and 'dir' are aliases to the ls-binary, but with different parameters so their output differs a bit.

> pppd: cannot determine ethernet adrdress for proxy AR

?? I honestly have no idea whatsoever what this means...

> stuff... (was afraid of that already)

Linux does not use the Minix-filesystem by default, it use the much better ext2-fs. Install the ext2.xfs for MiNT and you should have full access to your Linux-partitons from MiNT. You can also mount the minix-fs and FAT/DOS-partitions in Linux, so both systems should give you full access to all partitions.

Considering the price and availability of second-hand Amigas and
060/PPC-accelerators it would be cool to port MiNT... I once tried to
run MagiCMac under Shapeshifter on a A3000/060, it *almost* worked ;-)

Howdy Kellis,

I fetched the ext2fs stuff from Frank's site yesterday. I first need a recent kernel, I think I'm on 1.15.1-0.2 now. So gotta look for 0.6 first. BTW, the .lzh archive I got first refused to unpack, complaining "dir not available". Next I tried creating the dir manually, no way. Simply couldn't create it... :-) Then I got the tgz bunch and I had it unpacked in 30 secs...

Yup, well I'll leave it as it is now. By now I can use VI checking logfiles :-)
>
>As far as the GUI, good luck running that on your atari. It will work, but
>not very enjoyable experience, I can tell you that.

That's what I figured already... anyway, this whole bunch is just a tester for me. Probably remove the whole bunch again later. Plans are for a P-450 somewhere in September (Oboy, what am I saying and to whom am I saying it?) which will get a second drive which will get Linux onto it. Got a complete Redhat 4.2 on this CD, incl. XF86 for it. Not the latest, I know, but it's good enough for a start. Somehow I'd like to get hold of a SuSe distribution.

>Getting linux up is not that hard, the problem is what you can do with it
>efficiently. All the "interesting" programs out for linux won't run on
>your machine, and if they do, will be HELL slow.

Well, see above. The Atari is for some practising right now :-)

>And "no" to answer your question about binary compatibility.
>A linux prog even for 68k will not run on MiNT, or TOS or magic. Will only
>work in linux68k OS.
>Hope clears some things up.

It sure does... much appreciated again. I reckon the XF86 on my CD (for the Redhat 4.2 i386 dist) won't run on my m68k Debian dist.... Same for the one for NetBSD on the same CD...
>
>Btw, personal opinion, after using Solaris (work everyday), HP-UX and
>Linux (i386), I can tell you that MiNT is extremely efficient, fast and

Hi !

Do you know about the SETI@home project ?
The idea is to use the CPU time "wasted" in all PC and MAC all around the planet in order to find the detection of Extraterrestrial signals on the radio spectrum.

So if you have access to a MAC/PC, you can help the world find E.T in the name of ATARI:

Joe Mirando created a team for that:

To register youself at ATARI Team:

* Download seti@home for MAC/PC :
http://setiathome.ssl.berkeley.edu/index.html

* Register at:
http://setiathome.ssl.berkeley.edu/cgi-bin/cgi?cmd=team_lookup&name=Team+Atari

See you, Jean

> software.

Well, it is always a good idea to write user-friendly software, thats for sure. However, there are often issues which depends on what software/hardware you run on, and then it is appropriate to consult the manual to find out how it concerns you and your setup.

Therefore I think that people who run into trouble and are to lazy to recieve the help that they got right in front of them (in form of a txt/hyp-manual) has noone to blame except themselves. I *do* agree with you that software ideally should be possible to use that (without reading the manual first) way, but I think it is plain stupid not to read the manual if problems occur. That why it is there! :)

To me it makes more sence to consult the manual before consulting the newsgroup. The manuals are written for this purpose.

> I truly believe the easier the install the more likely someone will
>use a product.

Agreed. But that isn&#65533;t a valid excuse to ignore the manual IMO

> Well enough of my rambling Im off to play with more software.

So will I ;)

This is the sound of the switch-mode power supply trying to maintain its output voltages. There is probably some sort of short in the rest of the electronics which is causing too much current to be drawn.

> Can this problem be fixed by either me or a repairer ?

Hmm. Depends how good/lucky tou are at tracing the real fault. You may see a leaking capacitor on the circuit board (bingo) or you may not (what next?). If yoou have to go to a repairer he will probably charge you more than the monitor is worth.

> Has this happended to anyone else ?

Ho yes :-)

Hi Gary,

Can't tell you anything about Devpac, but STinG 1.15 works fine with MPC
1.2. I had a few problems to start with, but this turned out to be easily
fixed (make sure the port settings in the STinG serial CPX match MPC's
serial port speed and if it connects and logs in but won't do anything else,
bin CACHE.DNS as it's been messed up somehow).

Haven't tried the latest STinG yet.

> and an ST to send files both ways connected to a com port?

Try Ghostlink. It's in the Quick FAQ.

Otherwise, any terminal program should do. If you really want hassle,
you could try STinG and FTP.

> said NO docs were read before I started with Adamas either.

Because Draconis uses it's own non standard TCP/IP stack. The problem
with this is that you are limited to using software designed for it. You
cannot use Okami, AFTP, Atari IRC, etc... while you browse with
Draconis.

The same goes for CAB 2.x if you use it with PPPConnect.

CAB shares a standard freeware TCP/IP stack (STinG), which is used by
many other clients. The CAB.OVL is needed because CAB was initially
designed as an offline browser. It needs an extra software layer to
communicate with the TCP/IP stack.

Programmers don't want to all redesign there own serial port drivers or
TCP/IP stacks just for the hell of it. If something already exists,
works reliably and is widely available, then it's better to use that.
That's why HSModem and STinG are required by some programs.

As someone else said, it's nice if a program can be set up without
reading the docs, but if you run into problems, then you are expected to
read them. There's not much work in double-clicking on a readme.1st
file.

> Everybody seems to be taking this personally. And its not a personal thing its

>
> Don

Well, Cab seems to be a dead horse now anyway since the author has gone
Mac, and is trying to compete with IE and Netscape, which is pretty
silly if you ask me.

IMO, the future lies with WenSuite or Draconis, whichever decides to
implement STinG compatibility first.

If it doesn't work at 25MHz with a standard 4Mb card it's probably not the RAM that's the problem, but something else. I have never heard of memory-cards that doesn't work at 20MHz, so I suggest you check your installation again.

You can either set variable `dispgrps' in o.inf to 2 (display all
groups), or leave it set to 1 (display only groups with any messages,
no empty groups) and create a fold `Out' in folds.inf, like this:

Out Outbound*

and you will be able to access your Outbound archive group by mouse
click in the Groups window.

The Outbound archive group of the current user can also be opened with
"Open Group" and `O' (capital).

The hardware isn't the only problem here. Once you've managed to get an
Ethernet adaptor for the ST, you'll also need to configure a Proxy server on
the PC that's connected to the Internet and set up the TCP/IP stack on the
ST so that it uses the DHCP service to access the net. Good luck!

You must consider an important fact: The latest Mac browsers (Netscape and Explorer) require a PowerPC processor, whereas iCab doesn't.

I believe the last 68k version of Netscape was 4.08; Explorer, 4.01. This forces people with 68k Macs to be shutout of new features, like better support for Cascading Style Sheets (although still pending in iCab). It's this niche market -- perhaps a million machines -- that iCab is targeting. The only competition in this regard will be MacOpera, which I'm assuming runs under 68k.

As browsers become even more bloated, slower PowerPC machines, or those with very little RAM, can also take advantage of iCab's compactness. It's just too bad that none or very little of iCab will trickle down to the Atari version.

>
>Didn't you notice that WenSuite uses a compression algorithm which is not very lucky
>when displaying pictures ? This can explain the speed but also the display quality
>which is really poor;

Aha back in town.
Yep I noticed that. In one of my previous posting I said that there wasn't
a big different between Cab and Wensuite when the same pictures were
displayed in 256 color mode. I've made a mistake then. The picture I used
to test was almost the same viewed with both browsers but I do have
other pictures which looks rather awfull with Wensuite. BUT this different
disappears almost completely when I use 24b mode. There is still a little
different but only a moaner will complain about this.

For the moment Wensuite can't beat Cab but it's coming very close now.
I wished that Wensuite could be used with MiNTnet or STing instead of with
his own TCP/IP stack. Why are all these software houses re-inventing the
wheel instead of implementing the two Atari standards? MiNTnet works
impeccable, STing does also a great job so why on earth must packages like
Wensuite and Draconis come with their own stack? IMHO a real waste of
energy.

When it comes to Mac & PC there is another browser that moves in the right direction. Netscape is through the Mozilla project rewriting their Browser engine to be both fast and highly portable, so that it can be easily used and implemented by other programs. Sounds very, very neat to me!

It has not yet reached beta-stadium, but there are early developer versions for download. Check it out at:

http://developer.netscape.com/software/communicator/ngl/index.html

Oh, I see... So he isn't even leaving the Atari world for a more
mainstream platform. If he is dumping the Atari for legacy Macs, I
really don't see the benefit.

68K Macs already have Netscape 2.0 or 3.0, and iCab is still far from
beating those.

Atari compatible joysticks are pretty simple beasts. I'm sure it must be
quite easy to wire up a Sega/PC joypad to run with an Atari, if you
change the wire.

If I remember right from my CPC464 days (I once built a special 6 key
keypad that connected to the joyport), each wire (U/D/L/R/F1 and F2)
goes to a switch that connects it to +5V when pressed. That's it.

Perhaps the reason for the 'cross over' of CAB's author, is the 'perhaps a million machines', in the 'niche market' that Neil Roughley refers to. That's one hell of a niche! It's a fact of life that there's always more money to be made on the 'dark side' than in the company of the good and righteous. I just wonder if the author of CAB/iCAB, if he ever does think of updating CAB, will say 'why the hell should I, when, after all the time, a good proportion of it free (when CAB was PD), that I devoted to the ST market, they couldn't wait to stab me in the back when I tried to do what most of them would do themselves, ie make a bit of money'.

Talking about crossing over, I'll mention yet again Tom Hudson, the author of the CAD-3D part of CyberStudio. I've just got hold of an excellent book 'The Art and Science of Computer animation', Stuart Mealing, intellect. in which the author devotes two pages of screen dumps (two of CAD-3D and two of Cybersculpt) and 4 pages of description extolling this software in the company of some very big stuff for the Mac etc. Tom Hudson left the ST market, probably because he had stretched the hardware to snapping point (Mealing says that Tom Hudson tried to achieve in the ST (with some success) what he found in workstations) and went on to write 3D Studio Max. I just wonder what a Falcon/DSP/FPU version of CAD-3D would be like!!!! As a further boost for the ST, when he comes to exemplifying a GUI, Mealing opts for GEM not Windows!!!

Bob-King.

Like Nicolas already said, you should take a look at my pages.
The best thing you can do is using your STE to do the IP masquarading.
The home-page of Olivier Booklage tells you more about how to to this
with STinG. You can find a link to that page on my pages in the LAN
section.

>energy.
>
Martin,

just think of Microslop, I recall there *was* an HTML code already, set up
by some kind of comittee....
Next MS implements their own stuff, and the whole bunch goes running
behind it....

Perhaps OXO and Draconis people have similar ideas? :-)

BTW, I reorganized the lot of my HD's today, reducing the number of
partitions on my fixed disks from 11 to 7 now. Also got rid of the Linux
bunch, since 1. I can do better with these 2x200 meg partitions, 2.
Without a nice GUI I feel like stumbling around in DOS, 3. To get a nice
GUI running OK here I probably need a faster beast.

-whisper mode turned on-
Yesterday I ordered a new P-III with 450 MHz, 8.4 gig drive, 17'' screen
and the lot (yes folks, incl. Loose-98) which will probably get delivered
in September.
Next step is hook-in another drive with Linux and from there I hope to
enjoy this OS incl. a nice GUI. The 98 stuff will be to work in Word an a
few apps that I like from the platform and are not available for Atari or
Mint.... Also I'll probably start Internetting from that machine mainly.
-whisper mode turned off-

No way! My wizard should be above 10 MB for them to accept me. Still
some of us make a living supporting their crap, and then take the
time to write some software for our platform now and then. When (if)
they ever go away, then we'll have the real problems ;-)

LMAO!!
>
???

Anyway, there is nothing personal, sorry if it sounded like this.
In fact your research in Web Browsers was interesting, but as the other
guys said, our resources are limited and sometimes we consider ourselfs
lucky if there is a manual explaining the software's features.

Even though I'm using it the other way around, ie the TT to connect to the
Internet using STinG + Masquerade and the PC through ethernet, there is
a program for the PC called WinRoute that does something like it. There is
no need to configure a Proxy server or DHCP (although supported), it can
be done with 'conventional' methods, ie with the IP address. And if the
STE has a fast modem port, the first method can be used without problems.

As for the STE ethernet, the easiest (?) choice should be a pocket
adapter for the ROM port, I've tested mine a few days ago, it works fine.

From: h3n_b0k_b0k_b0k@my-deja.com
Message-ID: <7n59rv$6ua$1@nnrp1.deja.com>
Source record: 75678

I'm trying to back up old Atari diskettes. I'd like to get the images on cd or something, so that I don't have to worry about them going south due to old age.

How do I mount Atari diskettes in linux? Strangely, mounting them msdos doesn't seem to work.

Thanks.

A main problem. Same here, several times. I quit that.
I doasnï¿½t like to waste my time with sensless emails, they doasnï¿½t
response. One and only part left here is apex.
Other parts, nemesised falcon included, i sell to other people.

> >2: High fan
> > --------
> > The CPU fan is too high. Even when it is slid down to its lowest

Some electronic stores had flat ones, very flat. (Notebook fan)
But we should not solder on CT2.. Cut wires, remove high fan.

My "A" board comes (last year) also with cuttet fan corners, but it
works. Keyboard doasnï¿½t touch the fan, but the lower corner of the
cooler block extremly near the -12 connector of the internal PSU.

A smaler bock would be nice, works in the same way..

> The cable I received is grey and just like a 50 pin ribbon cable.
> All wires are connected together with a thin piece of insulation.

Arghs..
They doasnï¿½t gave colorised flat wire? What a joke..
Itï¿½s allways better with colorised wires..

> I have some general questions about the CT2 v.B, I've not completely
> read the documentation yet so I hope I'm not asking something that is
> already covered. I'm not going to do any thing that will void the
> warrantee on the CT2 v.B until I have it working correctly.

> Since I have a working Expose, I would very much like to use it with
> the CT2 v.B board if possible. I know it is next to impossible to have
> both boards in a standard Falcon case. The only way I can see that I

Same here with the screeneye. (Selled last week, i doasnï¿½t use it again)

CENTEK tells me that i have to put the screeneye below ct2.
That sound like to solder a slot to the backside of the srceeneye.

I do that, but i doasnï¿½t test it. I canï¿½t found the time, also i
selled the board last week. I think you can do the same with your
exposeï¿½. Thatï¿½s nearly the same as screeneye.

I canï¿½t found any word about that in any doc.

> might could use the Expose with the CT2 in a standard case would be
> to use some ribbon cables and run the Expose outside of the Falcons
> case. I'd much rather get sometype of replacement case for the Falcon

Yes, but were you like to connect the flat wire?
I think isnï¿½t a good idea, high bus clock an long flat wire are not
a nice couple..

> than do the above. However, I'm not sure if the Expose will work with
> the CT2 v.B if sometype of pass thru connections are made.
> Do you or anyone else know if the Expose will work with the CT2 v.B?
> If so, should the Expose be on the bottom with the CT2 v.B on the Top
> or the other way around? Does it matter?

Bottom, best way. Only way to find out, try it. I canï¿½t remember me that
anybody here use a second bus expansion since fit the ct2.

> If it does work will I be able to use all that extra memory with Apex
> Media to grab video?

Well, apex works fine with the ct2, but i doasnï¿½t check video grabbing..

> Also, does the CT2 v.B have any effect on the Falcons cartridge port?
> I have a VideoMaster Falcon cartridge, Will I still be able to use it
> with the CT2 v.B?

Sorry, doasnï¿½t have any answer for you. One an only i tested:
MidiCom Romport interface. Works fine! (Network beetween two falcons)

> Are there any known problems with any 2.5 IDE hard drives with the
> CT2 v.B? I have a Toshiba 2.5 6.4gig IDE will this one work
> correctly?

Original 64MB conner doasnï¿½t work in turbo mode.
Also a 540MB hitachi modell..
Also my old IBM DPES 31080 (SCSI) doasnï¿½t work with ct2 (turbo)

I use an toshiba 2.5" IDE drive (2.1MB) of the MAT series -> perfectly!
I think bigger ones works also fine.

> And finally, I am looking for a replacement case for the Falcon if
> I need to re-case it. I would like to find one especially designed
> to do this. That has enough room for aftermarket cards and etc.

Expensiv..
Tower or desktop cases looks nice, but also expensiv.

Older lighthouse cases had sharp metal corners!
Also the internal psu is NOT shilded!

Pentagon in germany sells a flat desktoper case, nice outfit, expensiv.

I create a flat desktopper case with transparent (smoke colored) acryl
glass, case have ALL holes for ports, floppy ect..
I doasnï¿½t use it.
(Can make a picture if i got the video board for my G3)

> I really don't want to use a PC type case.

Grey monster cases ;->

You can download the files for the ROM-port device from the Belgian FTP
server, or from Vassilis his pages :

both links are available on this page :

http://gallery.uunet.be/saka/atari/network/projects.htm#vassilis

Concerning the adaptors, you can find several types... just make sure
they have a RealTek 8012 ethernet controller. You should look once for a
Genius parallel pocket adaptor.

The answer to the original question would largely depend on what the user intends to do with the program. For persons with a rather artistic attitude who need functions like dithering, smearing, filtering, etc, some other program might be a better solution.

But for those with a technical turn of mind, who need to make a diagram, an illustration for a manual, a sketch for a workshop, or a mask for silk-screening, or similar, I vote for MEGAPAINT Pro. Besides the features already mentioned above, it has a number of CAD-lik functions like dimensioning, drawing lines orthogonal or paralell to a reference, etc. It can read and write .IMG and .PCX files, and can use a number of external modules which permit handling of .CVG and .GEM vector files, vectorization of bitmap drawings, importing of Signum and Calamus fonts, etc. And to some people it may be important that it supports layers- up to four bitmaps and four vector pictures can be displayed transparent or semi-transparent one over another, and drawing operations can be executed on a non-current layer.

Shortcomings: it uses only its own file-selector, it is rather picky about display resolution: on a ST works only in monochrome and not with overscan (there is a version 6 that works with overscan but not everything is ok). And it makes an error ih the file header when it writes .PCX files- picture size and resolution are not written correctly, and some programs are nervous about this and would not read such files (some other programs read them quite well).

I have heard once that there is, after all, a colour version of Megapaint. Can someone confirm or deny this?

Cu.

I don't know the solution but here on my Hades I can use PI 1.12 under
MiNT/N.AES.
BTW: do you have 'hires.rsc' next to posimage.prg (or pos_o40.prg).
That's is maybe you problem. You have to copy hires.rsc from pos_img\resource\
to pos_img\

2193. SH204 problem

Newsgroup: comp.sys.atari.st
Date: 1999-07-21 00:00:00 UTC
From: Jim <jtdon@direcpc.com>
Message-ID: <379652FF.80B9E2CA@direcpc.com>
Source record: 75689

Hi,
I just bought a bunch of Atari items including an ICD Fast drive and an SH204.
I managed to get the ICD drive up and running, but the SH204 is a problem.
Running ICD utilities I find nothing on the Scsi or Asci bus, using HD Driver
7.5 I find a QMTI on Asci 0,0 and 0,1 but if I go to format or partition nothing
is found. Using Supra utilities shows an adaptec 5500 controller, but again no
valid devices attached at the format or partition stage. The unit has a dip switch
inside, does anyone know the correct settings for this or have any other solutions ?
Any help would be greatly appreciated.
Jim Donovan

Bob,

You just verified something that I suspected about Magicmac 6. I never owned Magic 5, ^ was the first version I ever saw and used. When I received my version I was confused by the manual, because it talked about things that weren't in the package I received.

You are the first person to have the same findings as myself.

Thanks for posting your findings; Maybe now more people will do the same.

SAK :)

I chatted with Alexander at Neuss about this and he already has the faster routines written by the 2B's fort iCAB and will try to find time to retro-fit these to CAB. The problem is simply on of time and money.
I personally don't think Wensuite or Adamas are the future, they've both been around for years and neither have enjoyed a major development push.

Hi guys

Been a bit quiet since I bought my PIII. My poor old Falcon hasn't even been turned on since :(

Has anyone got experience of using the latest (whatever that is) MagicPC? In particular with Devpac3 (for development) and STinG for TCP/IP? I would dearly love to continue developing my programs such as POPwatch/NEWSwatch etc. but don't really have room for both my Falcon and PC to be set up at the same time (I'm not planning on binning the Falcon, just don't have room for both right now).

Is MagicPC a viable answer? Anyone?

Gary

Source record: 75732

Hi guys

I've been a bit quiet on the Atari front lately. In fact most of the names in this conversation, I don't even recognise. How quickly the Atari world changes (I've only been absent 3 months or so). Anyway, seeing this thread, and the fact there is a Team Atari, prompted me to join.
I've added my 80 work units, and 1500+ hours of CPU time to your cause. Shame it's on my PIII and not my Falcon!

A Falcon DSP version of the seti program would be cool, even if it was just a command line one like the WinNT or Unix ones. No need for fancy graphics. I really can't see the guys at Seti having the knowledge to code an Atari version though, to be realistic :(

Sorry to "Tannoz" though for stealing his first place ;-))

returned an error message.
>

As someone else pointed out, it's probably an alias. You can check that by
issuing an "unalias" command, but I can't remember off hand whether you need
to "unalias dir" (most likely) or "unalias ls" (farr less so). The alias itself
is probably being started by a shell script in your home directory - check
for .bash.rc (or similar, depending on the shell you use and the exact
convention of the filenames).

Another useful alias related command is "unalias rm" - a lot of distributions
alias rm to the interactive version (same with cp and mv sometimes) so that
you have to confirm the deletion of every damned file. If you're sure you
know what you're doing, issuing an "unalias rm" will get you back to the
"normal" non-interactive version.

As for the asterisks, you might find that dir is aliased to "ls -F" . The
-F switch, IIRC, appends an asterisk to executables, and a forward slash to
directory names.

>

Possibly. I've got one going unused at present, but my nemesis installation has not gone well, leaving me with only the slower of the new bus speeds, so I might find that I still need it. If you can wait a little while, I'm intending to order some replacement memory in the hope that it leaps into life (neither speed worked with my old memory upgrade (ironically enough, bought from Titan/Core in the pre-nemesis days), but swapping my old ATari 4 meg in allowed the slower speed to work. I hope that a new upgrade will let the faster one work, too).

If any of that makes some sense to you, drop me a line and we can discuss the details: I'll probably let it go for the cost of postage rounded up to the nearest glass of coke - whereabouts are you?

Cheers,

Xav

BTW it's a Screenblaster 2 - I prefer it to the BlowUp (owned both, gave the former to an ex-girlfriend)

The problem is the hardware, since there are no LAN adapters for the
Atari. You have to build an adapter to standard LAN adapter. Have a look
at this page:

http://gallery.uunet.be/saka/atari/index.htm

Hey Bardo,

Don't want to brag :) but I got my 520STfm at a school fete for £1.00 with assorted disks and manuals.

Need a mouse though so if you find where they are available please let me know.

Cheers,

Steve

But I need a mouse

So your adapter is compatible with the TUW-adapter? Great! I downloaded it
yesterday but I haven't had time to look at it yet.

2218. HDDRIVER/FALCON

Newsgroup: comp.sys.atari.st
Date: 1999-07-22 00:00:00 UTC
From: "Oe.Trollsaas" <oys.troll@c2i.net>
Message-ID: <eWMl3.1129$vX4.109505@juliett.dax.net>
Source record: 75548

hello!

My equipment is a Falcon with 14Mb ram, and I have now two SCSI-2 HD's connected to it, both of them Quantum, one lightning and one fireball tm 21 s 011, 3.5 series. I'm using the FALCON for CAF, but just now I can not use it, the reason as explained above (can't drive the harddisks with HDDRIVER, bombs and a noisy picture for two seconds shows up and no harddisk opens). I can open the Quantum lightning with AHDI, but not the fireball, that was the reason I bought HDDRIVER. I tried the DEMO version before I bought the real one and at one point I managed to install the HDDRIVER and open both of the HD's, but I did something wrong, maybe dobble installed the HDDRIVER or used both of the DRIVERS (AHDI and HDDRIVER) at the same time. When I tried the demo version HDDRIVER now, "TOS error #35", showed up without bombs and noise picture. Something has happened with the configuration or inside the FALCON, I don't know! Now I can't even open the CAF (after driving the HD with AHDI), because the message "Data on the disc C: may be damaged" appears. This is very frustrating, I hope you can help me! I have read the manual and followed it, but I think the mistake have been done before I tried to install the real HDDRIVER. Now I have cleaned up the AUTO folder and the CPX's, but nothing seems to work!

HELP!

Oystein Trollsaas

>Don

Well, I had 2.0 running kind of, it gave me the most troubles, I D/Led
the 2.7demo and just moved the files into the same folder replacing
the 2.0 files. I havealso gotten the newer OVL's and pluged them in
too. The only trouble I realy have now is the FTP part, it worked with
2.0 (came in the set of files), but doesn't work with 2.7, givesme
the error message RSC not found. Other than that,it took maybe 15
mins to get it up and running and that's counting the time I read some
of the docs lightly.

Someday you'll have to seeif you can cross that l.a./kern county line
and see my TT030 setup. It was STing that I had the most trouble
with, and then I got a lot of help for it. Then when networkone went
and changed their servers over to " Easy Access " that's when it went
to H*LL in a hand basket. Easy Access My *SS.

I personnaly use MagiC PC everyday, it's very stable and Devpac works very fine
on it :-)
but you can't use the 68030 / 68040 / 68060 specific instructions, MagiC PC
emulates only the 68000
for info Oxo Systems is developing Wensuite and XXL on MagiC PC, I think it's a
good indication ;-)

Yes as someone already pointed out, it now exists for Draconis aswell. Keep in mind this program is not even released yet and is only in beta, so much could change.

> IMHO there are only two Atari-standards, MiNTnet and STing. I-connect is
> not a standard as it can only be used (fully) with MagiC.

Although I agree Mintnet and Sting are the 2 strongest standards, why should it matter that Iconnect can only be fully used with MagiC? Can Mintnet be fully used with Mint? or even at all?

I use Draconis in 24bit resolutions all the time. Ofcourse my falcon can
not achieve this so this is under MagiCMac. This is with the latest demo,
I am not a registered user.

> missing, rendering of the colors is very bad, etc...

It seams to have tags missing in Cab.
What about the JavaScript support ? Did you have un chance to test it,
even offline ? Or someone else ?

> Due the extremely high instability I still haven't use Adamas online.

I did try Adamas demo this afternoon (not the last one, just 1.6 pl 1).
I was surprised not to have a crash like it used to be with previous
versions. I even got connected to my ISP. But it's slooow on my
Falcon, much more than Cab, at the first load. A lot better after the
pages are cached. Colours ? Well, not so bad in 16 colours mode. But
the layout is not so good. Previous/next works rather well with
frames.

Bye,
/Pascal/

The most obvious hardware is a nullmodem-cable... Using MiNTnet or
STiNG he can set up a PPP-connection to one of the PCs. It's a bit
tricky on the PC-side, but I have seen a couple of FAQs on how to do it.

Why do you need a proxy? IP-masquerading is much more versatile, e.g.
by using Wingate on a NT-box.

on the
> ST so that it uses the DHCP service to access the net. Good luck!

There's no need for DHCP on such a small network.

I noticed this project yesterday, nice work :-) I already have a DE600
but no adapter (it's just not possible to make working PCBs from the
HPGL-files in the TUW-package) yet, so if you write a driver for
MiNTnet I'll probably buy a PCB from you and forget the DE600...

I'd have assumed that Olivier (and Dan for that matter) would already have
tried to make overlays that would empower us to access more of the internet,
so I'm not holding out much hope. But please, if there is anything that you
can do! :-))

I wouldn't mind betting that you therefore missed the bit about ensuring
that you use the right overlay: The one that comes in the CAB package is
only for use with a MagiC/IConnect setup.

Brilliant. This will be a great help. Take a look at Bengy's MagiC support
web site for some examples of translation work, which will be greatly eased
by such a utility.

The same goes for Cab. 2.7 has been around for ages, and even then there
has been no huge changes since the earlier v2.x. The main problem with
Cab is speed, and that has not been addressed.

WenSuite 3 is a huge improvement over v2, but they have this thing with
releasing beta versions that crash too often, and they also don't
communicate too well, especially on the international scene. They are
pretty responsive in the french newsgroup though.

2242. CT2B Problem Fixed!!!

Newsgroup: comp.sys.atari.st
Date: 1999-07-22 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7n6h7l$lhh1@news.ajou.ac.kr>
Source record: 75610

As some of you may know, I had a problem getting HD Driver and
ExtenDos Gold working in the Turbo Modes on my CT2B Falcon.

I finally found the problem. The Solution was to change the
Resistor that came with the CT2B for the SDMA to a 100 Ohm resistor.

I used the 100 Ohm resistor from the Nemesis 25/50 Buffer
Modification.
I had replaced that resistor with the one from Centek.

HD Driver and ExtenDos Gold worked the first time I tried them in
Turbo Mode. Now all drives including the CDR and CDROM work excellent
in normal and Turbo Mode.

I ran NemBench to see if I lost any speed with the 100 Ohm resistor
installed. I didn't loose any speed, But Gained 1% on the 32 Bit Read
(FastRam). Cool!

She's running like a Dream. :)

Also, after doing some testing with the Video Modes I found that I can
do 800x600 in TrueColor with CentScreen and CentVidel on the 17 inch
SVGA Monitor! Pretty Good for not having a Graphics Card installed.
This has nothing to do with the Resistor change by the way.
Also, I still haven't done the VGA Adapter Modification. I really see
no need too.

I'll e-mail Centek and the rest of the folks that I have pestered with
this problem and let em know.

I hope I get some Credit for this Fix. ;)

Both Dan and Olivier have done it already. However, Dan's point is
that his OVL should work on plain TOS, which is where STiK/STinG is
used the most, so he hasn't given much attention to password or SSL
nor to non-blocking schemes, because it would require multi-tasking
and then one has to make a choice about which OS threads to support.

In real life, Magic users prefer I-Connect and MiNT users MiNT-Net,
so that's where people should look.

Authentication and SSL doesn't need any multitasking, but porting
SSLeay (the SSL-library that's used in CAB.OVL for MiNT-Net) is a lot
of work. I believe all current OVLs support authentication.

> In real life, Magic users prefer I-Connect and MiNT users MiNT-Net,
> so that's where people should look.

Well, there's a lot of MiNT- and MagiC-users that use STiNG too
(probably just as many as there are MiNT-Net- and IConnect-users), and
with GlueSTiK and iFusion available it looks like the STiK/STiNG-API is
the way to go for max. compatibility. I totally agree with those that
finds STiNG harder to program for than sockets though.

If he does update CAB, then, after all the flack he's taken here for trying to make a buck, he being very generous. Re the latest CAB 2.7, It's worth the upgrade fee, if only for the quicker reaction to the stop button, but why waste drop-down menu space by two auto redirections to ASH web sites. What happens when they change their URLs? As far as the lack of speed, I now use the autosurf module a lot, espec. for graphics intensive sites. It works a dream and gives 'phone time zero off-line viewing. Had a bit of trouble finding the loaded down files until I found them in Cache. This should be in the manual!!!.

I don't think that this is a good idea, and hopefully nobody is working
on this plan.

Why?

- It adds non-kernel functionality to the kernel,

- it makes updates much harder,

- we need another set of precompiled kernels for those people who don't
need networking.

Instead it should be moved into a shared library, this is where it
belongs.

I sure hope that this is discussed again in the MiNT list in case
somebody really started to work on that!!!

I can't speak for OXO, but the reason for us (the Draconis Development Team) to program an own TCP/IP-Stack was much more simple.
It's surely right, that's Mintnet works fine, but have you ever tried to run an Webbrowser with Mintnet on an 1 Meg ST?
Adamas (the Draconis Webbrowser) runs fine even on this kind of machine!
And to program clients for Sting means a lot of work to do for each applikation, cause the Stack isn't really powerfull and the calls aren't compatible to anything else.
By the way, to the time we start to program the Draconis-Stack, only Stik was available.

Greetings

Stefan

>Euch, the machine will be outdated by then:-))

Martin, let's face it: if I had been thinking like that, I would have
trashed my TT a long time ago :-)
>
>>Also I'll probably start Internetting from that machine mainly.
>
>That's bad news.

Let's face the truth again: first of, I won't leave the regular NG's I'm
hooked onto right now. No reason why. I won't bin my ST, my Mega STe nor
my TT.
But: we had some discussion on this matter before: what about *browsing*
on an Atari? I think the Falcon's the best choice, because of the DSP. No
TT will beat that. Decompression routines are slow at 32 MHz... An old
486/66 will beat that.
What's the progress on the browser front? We just had this talk about
Wensuite and Adamas... well, we also know what we said... Not to mention
CAB.

A P-III 450 will do that a lot faster, whether that's using IE or Netscape.
The *major* reason for me to use a faster computer whenever I can get my
hands on it. This PC is an extra one, coming from a PC=private project
from my employer, it's gonna cost me 32 hours leave a year for 3 years. I
can live with that :-)

The other project here is buying TOS-compatible new hardware. Haven't
still made up my mind, it definitely won't be a Milan-040. Maybe an 060.
Maybe a dual 060 Phenix, if that one sees the light. It won't be a G3 or
whatever Mac for sure... IMHO Mac goes the same wayas MS ever since they
dealed with MS (Like MS finally at last managed to "produce" a bit decent
OS ever since they could look into Apple's kitchen... without that, what
would have happened to Win 3.11?)

Like I said: this PC comes in handy when I want to work on business stuff
at home for my employer (same s/w), plus finally at last I have the chance
to run some s/w privately, like Flight Simulator, Skyglobe and some others.

Another reason is Linux: I'd definitely like to try it out completely, including KDE/Looking Glass or whatever GUI. No way on an Atari. On the PC I can choose from 5 distributions, and on a modern PC at least it runs OK. Another option here is by setting that up, perhaps I can convince my boss of NOT going to NT or Win-2000 in about 2 years, but choose for a Linux/Samba bunch on a cheapo server with Win-95 clients all around the building (these are sitting there already).

The fact that I'm "buying" this PC won't mean I'm becoming one of these PC-freaks... Don't need a 6-D 256 Mb gfx card, or 512 bit ultrasubwoofer/hypertweeter soundsystem. I *did* order a P-III/450 instead of the Celeron 466, a 17'' screen instead of 15'' and 128 megs instead of 64. I do need the bloody Win-98 because of Word (or have MS decided to port it to Linux? If they're really smart they would... :-)

I'm pretty sure I will love to work my TT without hitting CTL-ALT-Del 10 times a day...

I could never get the Sebra mono emulator to work so I think the only solution for this is to go out and get a cheep mono hi res monitor.

>2) Magdesk doesn't see my CD ROM as a drive.

Which CDROM driver are you using?

I am using MetaDOS 2.74 and this works well under MagiC 6 with no problem.In fact the system saw the CDROM instantly.

Hope this helps,

Gordy.

Yes, the one of the clock wire.
The DMA part must get the clock with the right level and amplitude.
Thats all. After that mostly all DMA/SCSI touble is eliminated.

(Not only with the CT2, thats a global problem of the falcon hardware)

> HD Driver and ExtenDos Gold worked the first time I tried them in
> Turbo Mode. Now all drives including the CDR and CDROM work excellent
> in normal and Turbo Mode.

Sure, ran here since the first minutes. Very stable.
ExtenDOS gave me access to one CDRW and two CD-ROMs perfektly.
Also CD-Recorder2 works in TurboMode, but only with 1 speed while burn a
new cd. Looks like a problem of this old expensiv stuff..

All other runs nice.

No, not yet.

> Why?

Don't ask me, I'm just refering to a discussion between Guido Flohr,
Torsten Lang and a couple of other members of the MiNT-list.

> - we need another set of precompiled kernels for those people who don't
> need networking.

Sockets are not only for networking, in unix they're also used for IPC
locally.

> Instead it should be moved into a shared library, this is where it
> belongs.

Not the device?? I guess you mean the socket *library*, and yes - I agree
with you. However, the MiNT-lib is much more important in this respect.

> I sure hope that this is discussed again in the MiNT list in case
> somebody really started to work on that!!!

I suggest you search the archive and send some comments to the list.

This is the kind of thinking that results in...

a) ugly apps.
b) limited apps.
c) ==> delayed releases and slow progress. <==
d) poor interaction between apps.
e) endless reinventions and incompatible variants of the same services.

If somebody complained to me about one of my programs not working on a 1Mb ST with a single floppy I would politely tell them where to stick that ST...

If Draconis use sockets, what's the problem in supporting other stacks? A simple scheme with a loadable socket-library would solve this problem.

I have a rather fast machine (Afterburner), so the speed is not bad here
;-) But the main problem as I see it is the interface between CAB and the
OVL. It's a very simple scheme which doesn't allow for real mulitasking.
If CAB could only download multiple images and download while converting
them as well speed would improve a *lot*.

This can unfortunately not be done without either redesign the CAB<->OVL
interface, or change CAB to use external programs for viewing images.
These programs would then download, dither and display (using e.g. ID4 or
another simple protocol) themselves, possibly using threads or shared
libraries for efficiency.

I seem to remember that there was a MiNT-Net"-radiobutton in the
configuration-dialog in one of the early betas. Is it still there?

2258. What kind of cable to hook Zip to Falcon?

Newsgroup: comp.sys.atari.st
Date: 1999-07-22 00:00:00 UTC
From: "Brian T. Hutchinson" <brian.hutchinson@ericsson.com>
Message-ID: <37974DCD.FB1C9040@ericsson.com>
Source record: 75626

I have a Zip Plus and would like to hook it up to the Falcon SCSI port.
Zip manual says not to use gender changers on the cable but I know it
can be done because I have seen people talking about using Zips with
their Falcons and other Atari machines.

At Best Buy I saw a 50pin mini to DB25 cable. Would this work?

Thanks,

Brian

>this kind of machine!

I'm not a programmer but I can't understand why it's easier to develope a
new stack then to use one of the two standards. AFAIK, the sources of
these stacks are freely available.

If it runs! On my Hades Adamas Pro (registrated version) is just useless.
No TC support, crashes all the time. Lots of important HTML-tags are
missing, rendering of the colors is very bad, etc...

At the past Neuss-fair I've had a little chat with the programmers of
Adamas. They wouldn't believe me when I said that the browser couldn't
be used in 24b color mode. They had the same look in their eyes as the
cows of farmer Teun had when they show, back in 1835, the first Belgian train
passing by.
As answer I got 'check your setup and if the problem remains mail us'. As
I don't like this kind of attitude I never bothered to send then a report.

Due the extremely high instability I still haven't use Adamas online.
There was a time I found Adamas better then Wensuite because Wensuite
(2.56) crashed even more then Adamas <1.5. But Wensuite does make (big)
progress whereas every new Adamas version seems to work worser on my
Hades.
I can use Wensuite for a long time now without any crash, but Adamas
crashes within the 5 minutes. Resizing the browser window is enough to
crash my system.

>By the way, to the time we start to program the
>Draconis-Stack, only Stik was available.

MiNTnet was there already. I'm using MiNTnet since 5-6 years.

Maybe I'm wrong but I though this thing was invented to allow *I-connect*
users to use Sting stuff. I'm not a I-connect user so it's of no use for
me.
IMHO there are only two Atari-standards, MiNTnet and STing. I-connect is
not a standard as it can only be used (fully) with MagiC.

IKWYM. But unless a program is designed to use cut and paste options in all its fields etc, then it might be a problem.

>Lets say I am viewing a .GIF picture that has quite abit of text in
>it with a program such as ImageCopy or TruePaint.
>I would like to be able to cut out just the text in the Image and
>save it as a ASCII file. A ACCessory that would do this would be great
>or at least I could make good use of it.

But text in .GIF etc picture files is usually bitmapped isn't it? I doubt there's an easy way to convert this type of text, which is integral to the picture, to ASCII without some form of OCR being involved. Text in vector picture files should possibly be easier to extract as the component parts of a picture can be separated in a suitable program. You would then just select the element containing text and have it saved out as ASCII instead of going to an edit text box.

Kind regards

Mike Kerslake

Really ?
Perhaps, but absolutely don't expect any improvement in their program while giving them some information on your own tests:
They are the only left developers in France and they think they are God. Cab is a piece of s*** for these guys. They simply are the best !
Ten times I sent TT030 test information, ten times I was insulted ... but it's not really astonishing from such people ... their past is very heavy when talking about customer relation .... and nothing seems to have changed until now .... if WenSuite is in progress, they definitely aren't.

Yes, they are pretty responsive for such a kind of people ! They are believe me ...

Two things are possible:
- Nobody complains about their customers practices ... because they are afraid of Oxo behaviour ... I'm definitely not !
- In France everything is possible about illegality.

TransAction home pages

The TransAction crew creates translated software and by working together avoid duplication of effort. These _preliminary_ web pages include details of who has translated what and where you can get hold of it including download links.
The pages are maintained in english (by me) and in french courtesy of Sylvain Perchaud.

I want to encourage as many people as possible to join the TransAction crew so if you've translated _anything_ and would like to join the crew I'd be pleased to add your details to the TransAction pages. it will only become the definitive reference source if enough translators join us. ATM there's just stuff I've translated along with a few bits and pieces from Sylvain, Peter West and others so do stop by and give me some feedback.

I'll glamorise the pages and add a feedback section along with some other stuff IF enough people find the pages useful. If you find any broken links or other HTML problems please let me know.

InterActive finally closes

The InterActive shareware registration scheme finally closed on May 30th 1999.

I'd like to thank everyone who registered software through InterActive over the years which has put thousands of pounds into the pockets of Atari software authors, from which we have all benefited.

Most of the former InterActive pages, including program info, download links and details of the authors remain available and have been integrated into the revamped and relaunched TransAction web pages which I have recently put on-line.

It supports the Draconis-stack as well.

However, I believe that we need something that allows us to run WenSuite and Draconis on STiNG and MiNTnet, and not the other way around. STiNG and MiNT-Net are "real" networking-stacks, and not just "toys" for dial-up connections.

> IMHO there are only two Atari-standards, MiNTnet and STing. I-connect is
> not a standard as it can only be used (fully) with MagiC.

But then you can't call MiNT-Net a standard either, since it can only be used (at all) with MiNT ;-)

How about Draconis ? Ok it's not compatible with STiNG but
it is developed and works (which can't be said about Wensuite).

BTW AFAIK author of this program promised STiNG version if there will
be enough interest.

Source record: 75636

I've finally assembled my Stacy properly, but now that I'm installing software I'm having problems...

1. MagiC6 complains about a missing screen-driver and halts immedielately. I remember having this problem on my Falcon as well, but I can't remember how I solved it.
2. NVDI 4.12 complains about a missing offscreen-driver (it's there, I've checked) and halts.
3. HD-Driver 7.12 won't autoboot. I have to autoboot with AHDI 5 and put HD-Driver in the auto-folder. Is there a cure for this? It's not a big issue, i can live with the current solution.

Both MagiC6 and NVDI was installed on the STacy's disk from the Falcon, this *might* explain my problem with these. But it has worked before (on both an STE (1.062) and Mega ST (2.06), so I doubt that. I can't install directly on the STacy because ASH ships all their products on HD-disks and I have no idea how to split them without upsetting the installer :-(

The STacy currently has only 2Mb RAM, but I don't think this should be a problem.

AFAIK m$ networks will not allow using the serial or parallel port for
this kind of networking. One needs third party software like Trumpet
Winsock etc. But Trumpet keeps complaining in the negotiation phase of
TCP that STinG's ack numbers are wrong, so it's not much help.
Haven't tested with MintNet though.

How did you knew that ? ;-) I'm trying to do it right now(!) since in
my original posting of the project I asked if someone with greater
MintNet experience could do that and got no reply :-(

>I'll probably buy a PCB from you
>
Oops, I'm not selling PCBs, my small son acts as a virus ;-) around here
and I can't use acids or UV lamps safely, plans to make it are in the
archive (including the IMGs) and the components cost next to nothing.

>and forget the DE600...
>
Why? I'm using MintNet's DE600 driver right now as a guide to convert
it to RTL8012, thus there is a MintNet driver for DE600! And I guess
you can use my PCB with it (if you make one ;-), even connecting an
extra cable to the printer busy pin (I'll check this during tests).

Hi
I know this behaviour, but try to start the HDDRIVER.PRG from the
autofolder first.So open the autofolder on your floppy and start
running this HDDRIVER.PRG.When it fails again you have to pick CBHD
harddiskdriver from the Internet.it's very good and never failed me
in seeying the partitions/my harddisk.after then you can choose
either to use this CBHD , which is quite good or choose for HDDRIVER,
which I did, cause I bought it...

Thanks for the info. I'll take a look at it. However, I recently discovered
that the 3 CD ROMs I aquired (it's a "clip art" collection for PCs), also have
all the WMF images duplicated as TIFFs - hidden in a folder on disk 2. So no
need to convert these WMFs at least! :^)

And thanks to the others who responded to my question too.

Atleast with Win95 this isn't a problem, although finding good and free
NFS-software is very difficult. But the PPP-link is rather
straight-forward (if you're familiar with Win95), and I had no problems
with it back when I had a PC with Win95 (almost four years ago).

Message-ID: <3799040A.7AFBD5AD@midamer.net>
Source record: 75500

Hello all!

I am writing an article for an online magazine and need your help. The article is about writing in a limited budget. I am focusing on two machines. The Atari 800XL and Commodore 64. I have both, but no documentation. I would like to include info about Diamond OS and Atari writer plus.

Your mission, should you decide to accept it, is to help me get documentation for these two great Atari programs. My 800XL has been in storage for some time, as has my C64c. Naturally, when I went to refresh my memory on the use of these oldies but goodies, I couldn't find any of my manuals. (must have stored them somewhere else for some stupid reason.) So, please help a fellow Atarian out of a pinch.

If you have any information to share, please e-mail me direct at Lmartin@midamer.net

My sincere thanks,

Michael A. Martin

Hi Folks...

Currently on special offer from ASP:-

1Mb SIMM's, tested with STe, 3 UKP per pair, 5 UKP for four

SCSI Leads:- 1m long 50w High-Density D-plug (ie Falcon) to 50w Centronics.
Connect your Falcon to hard-drives and CDROM's etc that use the old-style
big Centronics socket. Only 10 UKP

Offers only while stocks last, but currently I have plenty of both.

You're using a Mac, right? I just tested the latest Wen.Suite, and it
crashes with a bus-error just when the menubar is displayed. This on my
Falcon with Afterburner, and it occurs regardless of cache-mode under both
MiNT/N.AES and TOS.

Source record: 75508

>
> Does anyone know of a PC program that actually does allow a PC
> and an ST to send files both ways connected to a com port?
>

Any of them will, as long as they both support the same transfer
protocol (zmodem, xmodem, etc). The only hardware required is a nul
modem cable, and a term program on each machine.
1. connect nul modem cable between the 2 com ports.
2. Run the term programs in dumb mode. They should show a high carrier.
3. make sure the recieving side is set for auto download.
4. Start sending the files.

I've done this several ways. Even set my bbs (Max OS/2) on the pc so I
could log in from the st over a nul modem cable. On the ST, I've used
both Connect and Ansiterm to transfer files over.
Almost forgot. Both sides HAVE to be set to the same baud rate.

Just out of curiosity, how do you you come up with prices for some of the games you are selling? $150 for Ultima II? I got mine for my Apple II for $10, I was just wondering how you came up with it being worth $150...

I also have Legacy of the Ancients in the box for my Apple II, what do you think that is worth?

Hi Jo,
Yep that's on a mac, both winsuite and draconis work fine. I was talking to
Ozk on IRC not too long ago, and I remember him saying that the latest
Win.Suite did not work under mint (on his Hades060).....

From: Mark Davies <pov@tesco.net>
Message-ID: <7nd88a$d6c$1@barcode.tesco.net>
Source record: 75514

After looking at the Team Atari group stats, I was wondering what computers
us Atariarians are using to process the SETI*Home info.

Name Units Average CPU time per work unit
1) Gary Priest 88 18 hr 30 min 45.3 sec
2) Bud Connolly 39 13 hr 55 min 52.1 sec
3) tannoz 37 16 hr 48 min 38.5 sec
4) Joe Mirando 33 17 hr 36 min 39.7 sec
5) Nicolas Roard 30 11 hr 21 min 09.2 sec
6) Elliot Swanton 20 26 hr 02 min 12.5 sec
7) Chris Emmitt 8 35 hr 45 min 11.4 sec
8) Mark Davies 6 80 hr 08 min 19.6 sec
9) sebastien 5 51 hr 53 min 33.4 sec
10) JeanLulu 5 32 hr 39 min 55.8 sec
11) Marc-Anton 1 109 hr 46 min 22.9 sec
12) ibral 1 0 hr 21 min 36.0 sec
13) dunk 1 16 hr 09 min 26.6 sec
14) BobJ 0 0 hr 00 min 00.0 sec
15) RMahlert 0 0 hr 00 min 00.0 sec
16) Penguin 0 0 hr 00 min 00.0 sec

So here I am at number 8 and I run SETI@home on

1) 233Mhz K6
2) 166Mhz Intel Pentium
3) HP 7000/712

What about the rest?

It's better we difference clearly between the socket device itself and the
socket library.

> Why?
>
> - It adds non-kernel functionality to the kernel,

For the library this is correct, a library is always part of user space.

For the TCP/IP stack itself it's much better then it's really integrated
into the kernel.

> - it makes updates much harder,
>
> - we need another set of precompiled kernels for those people who don't
> need networking.

Integration don't mean that it's all linked into one file.

I have a macintosh power PC and an atari 1040 ste. On the atari, i have the very good music software Cubase. I have found a lot of midi files during my surf on internet with my Macintosh. I'd like to use theses files on my atari with cubase and my synthetiser. So I'd like to know if it was possible to transfer theses files on a floppy disk from my Mac and then to use them with my atari.

Best Regards.

the RAM that's the problem, but something else. I have never heard of
memory-cards that doesn't work at 20MHz, so I suggest you check your
installation again.
>

I've checked the installation so many times that it hurts. I've got a degree in Electronic Engineering, and have been earning a living as either an electrical or electronic engineer for the past 8 years, so I think the installation's okay. If I had more time (and my own 'scope) I'd troubleshoot it properly.

What I do know is that the Nemesis won't work at all with my 16Mb DIMM card in, but will work at the lower speed with the original 4Mb. As I want a full 16 (okay, 14.3) back again, I've got nothing to lose by buying another memory card. As you say, it probably won't give me full speed on the Nemesis, in which case I'm going to throw in the towel, and settle for the lower bus speed, as I quite frankly can't be bothered anymore.

Thanks for the input though,

Xav

CAF doasnï¿½t have his own driver? CAF is not avaible here. ONLY a idea.

Othersides, some fireball models canï¿½t boot on a atari.

> bombs and a noisy picture for two seconds shows up and no harddisk opens). I

Normaly itï¿½s no problem to replace AHDI with HDDriver, both are "AHDI"
kompatible. Sounds like if you doasnï¿½t remove some parts of AHDI while
you use HDDriver. HDDriver installed hddriver.sys on root of you first
device, maybee on internal IDE Part. C:

(Or the first bootable device)

Thatï¿½s the driver for all connected drivers if hddriver found while
run the hddriver setup. (Watch the IDï¿½s! You can switch several IDs
ON/OFF) After setup you have to reboot the machine.
hddriver.sys will be loadet an mount all active drives. (Normaly)

> noise picture. Something has happened with the configuration or inside the
> FALCON, I don't know! Now I can't even open the CAF (after driving the HD
> with AHDI), because the message "Data on the disc C: may be damaged"

Yes, iï¿½m realy sure you use two hard drive drivers at the same time.
That will not work. Canï¿½t gave you a complete description how to install
the driver, canï¿½t see your system. Wrot only my ideas.

> appears. This is very frustrating, I hope you can help me! I have read
> the manual and followed it, but I think the mistake have been done before I

Isnï¿½t :) Remove the old driver. I do the same here years before.
AHDI is slow HuSHI also. Best what you can do for you falcon: HDDriver

> tried to install the real HDDRIVER. Now I have cleaned up the AUTO
> folder and the CPX's, but nothing seems to work!

Whitch release is your AHDI?

(Do not delete .sys files by drag to trash!, you lost drive access!)

> At Best Buy I saw a 50pin mini to DB25 cable. Would this work?

Yes, but i use it with a zip 100, no plus.

Other point, ZIP drive needï¿½s TermPwr. ZIP doasnï¿½t work it itï¿½s no
TermPwr on SCSI Bus. ZIP doasnï¿½t terminate the bus well.

ZIP works fine als followup to another scsi device on the scsi bus.

my chain:
ID7 ID6 ID0 ID1 ID2 ID3 ID4 ID5
Falcon ZIP 100 Quantum Quantum Fireball CD CD Yamaha
#######---#####----########--########--#########--##--##--#######--Terminator

Hard drives have TermPwr Jumper "on"

:)

Is the Nemesis grounded to the rail the runs on the outside edge of
the motherboard with leads coming from the "e" pads on the Nemesis?

Are you sure the oscillator in the second socket is making good
contact?

Did you try different caps, or even a resistor (~75-100 Ohm) for the
DMA mod?

If you have an FPU, is the clock in pin (you'll never find the trace:)
for the 68882 line seperated from the motherboard and fed by its own
wire either from the Nemesis (bad idea) or with its own oscillator?

Is this one of the "new" 50 mhz Nemesis or the older "48Mhz" version?
A lot of users have had problems with the new units, at least as far
as the documentation goes concerning traces that should (must?) me
modified on the newer versions.

It's been some time since I used my overscan equipped ST, but I've had great success with my Falcon if I make sure that the Videlity-supplied horizontal resolution could be divided by 32 without a remainder.

>I have heard once that there is, after all, a colour version of Megapaint.
>Can someone confirm or deny this?

It's possible to assign a different colour to each layer.

Perhaps a later version was released but I have no knowledge of it I'm afraid. Anyone know what the last version was?

It's a great technical drawing package as you say.

If your Mac is pretty recent, you should have a program that allows you to read PC disks. If you can, format a 720k disk on the Atari with the Desktop, and wack it into the Mac. Atari disks are basically the same as pc disks, so just copy the files onto the disk.

The program is called PC Exchange I think

Hi,

I'm sorry to say, but this new one is IMO another perfect example of how one should NOT create a website:

1. It takes far too much time loading/decompression all the bloody piccies, which IMO don't add to the attractiveness of the site at all. Of course, one can always discuss what does and what does not... :-)

2. It's not very clear what are links and what are not: one has to move the mouse around to find out.

3. The classic example of one person not knowing/understanding about reading contrast: black background, red text. Fontsize average, folks, *THIS COMBO MAKES YOUR STUFF UNREADABLE!!!*

I am in the lucky circumstances that I have a gfx card that can enlarge on the spot to 2x, 4x and 8x. For these kinda pages I definitely NEED this feature.

Normally, when I see sites like this I don't spend any second longer to look at it or click to another link. Guess I'm not the only one...

BTW, I just wonder how this site looks like in B&W: probably even crappier than in 24 bit rez! Poor monochrome websurfers :-(

AFAIK it`s a PC program now, I figure that they use color?
They left the Atari scene when the TT was delayed back in 1992 or was it
the year before.

cheers

Greetings all,

As you might have guessed by the subject line, I am looking for the URL:s of Dan Jones (Digital Dan) and Anthony Jacques. They both until quite recently had their webpages up and running, but now they are gone with no info or redirect.

If anyone has info on this, I would appreciate your help! :)

Regards,

Joakim

> Same problem here, for NVDI 5.

The solution is really, really simple. Just copy the installation-disks in chunks over to the STacy's harddisk and install it from there... I did it with both MagiC6 and NVDI 4.12 last night and both now work :-)

>> The STacy currently has only 2Mb RAM, but I don't think this should be a
>> problem.

> Do you really expect to have _any_ ram left, after Magic is loaded?!

With MagiC6, ZControl and STiNG loaded I have 850Kb free. This is enough to run AtariIrc, so now I have the Stacy connected to the TT which again is connected to my internet-gateway, the Falcon. Now, let's just hope that MagiC doesn't trash the STacy's disk as well, as it has done on the Falcon and TT...

Fully agree with you. I started downloading the page and then I went
downstairs to make coffee. I was just in time upstairs again to see Cab
converting the last image.

>3. The classic example of one person not knowing/understanding about
> reading contrast: black background, red text. Fontsize average, folks,
> *THIS COMBO MAKES YOUR STUFF UNREADABLE!!!*

Uch, I don't have probs with that but your are right. Lots of people has
troubles to read low contrast stuff. I guess I must change my UTSI pages
also:-)). Every web designer should be aware of that.
The fontsize looked alright for me though. I using a resolution of
1152x864x256 on a 17" screen. In Cab I'm using Baskerville as font for
normal text with a default font size of 12 points.
I must admit however that it looks much better if I use a font size of 14
points.
Maybe you could set the default size of the font a little bit higher.

>BTW, I just wonder how this site looks like in B&W: probably even crappier
>than in 24 bit rez! Poor monochrome websurfers :-(

You'd better say poor 24b rez surfers. I'm monochrome it looks good. The
pictures ofcourse looks awful but the text is very good visible, black
background, white text.;-)

Again here on my Hades I don't have to switch of the caches except the
'copy back' cache.
I don't think it's strange. Some, mostly older progs doesn't like the
'copy back' cache. Looknsee (even the latest beta 0.97) and Imagecopy 4.2b2
plus for instance. Especialy Imagecopy dislike the 'copy back' cache. Most
of the time it will take the whole system down.
Calamus SL95/98 doesn't like it either but Calamus SL99 seems to work with
that cache on.

Does anyone have a used Falcon Digital Interface (FDI) for sale?

I've used Cubase Audio on my Falcon for a long time, and now would like to get into CDr burning, but I need the FDI to do digital transfers from my DAT masters to the Falcon. The FDIs are still extremely expensive new from SoundPool though <ouch!> So any help locating a used one would be appreciated!

(For what it's worth, I live in Southern Californi, USA).

well, it's a long one definitely...

i'd just say that my CT2 Falcon was not more expensive than Pentium
133 or so....It takes some time to find but it is wortwhile since
Atari definitely works better and safer and easier than pc (especially
CT2)...I am heavy user of pc at work so I lerned to respect some
really nice things...True, pc at 450 mhz is fast but is sometimes very
unstable (when running windoes) and not easy to use...
and just why would ou need such a machine? most of the people need
computer for usual stuff - reading mail, browsng or preparing
document- all of it can be done even with a ST...
for enhanced graphics buy a Silicon Graphics...;))

Hi Martin. Thanks for the reply. I've got it now. Silly me, I forgot to
put the last " \ " after my paths:

u:\home\root\amail\inbox\
u:\home\root\amail\outbox\
u:\home\root\amail\sent-mail\

Whats so embarrassing is that I think I did the same thing the very first
time I installed the original release of aMail! (but remembered to do it
in all subsequent releases up to 1.2b) Go figure. Methinks I've been sitting
in front of my monitor far too long now (been updating scripts on my BBS-
like BASIC language). <grin>

BTW, ever notice if you use the fileselector to point to your paths in aMail
from the drop-down menu, that it always puts the slash like " / " instead of
" \ " ? Oh well... (or is it Freedom doing that?)

Catch ya later, and thanks again! ;-)

Louis <louis@holleman.demon.nl> wrote:

> I'm sorry to say, but this new one is IMO another perfect example of how
> one should NOT create a website:

Although nothing to do with navigation, color schemes, or intense inlines, along the same lines try validating your HTML, Louis. You'll be amazed at what you find, as I was validating my own pages. CAB's validator is missing some errors on your home page, notably with table structures.

A very good validator, although purists might disagree, is Doctor HTML:

http://www2.imagiware.com/RxHTML/

Go to the the 'Single Page Analysis' section and paste your URL. You're allowed to test four pages before the service times out for the day. This service is especially handy for analyzing table structures.

If you clean up your markup based on what the validator reports, CAB and other browsers will display the page quicker, since extra processor time won't be spent formulating the tables (and a few other things). Afterwards, I think you'll see a significant difference in performance.

Doctor HTML will point out all fourteen of your extra open TD tags. However, it ignores the redundant use of the rowspan attribute, which just adds to the extra processing time (no TRs are defined in the first place, which probably doesn't help either). On my TT, I can see CAB 'hiccupping' as it parses the page.

I recommend anyone relying on CAB's validator to use validation services as well. I use Doctor HTML in conjunction with the W3C's validator (http://validator.w3.org/), one that takes exception to some things that Doctor HTML doesn't (both have their own merits). The W3C's validator is buggy, though: My main TOS page validates as 4.0 Transitional, yet it shouldn't because in one case I use a percentage value to specify a table cell's width (that's not allowed according to the W3C's own specification).

Another validator worth mentioning is Website Garage:

http://www.websitegarage.com/

Run their free Tune-up, then click 'HTML Design' to see the error reports in detail.

All this is just friendly advice <g>. Validation is especially important if one does their HTML by hand. CAB's validator alone simply can't be

relied upon.

Well my question is how does one come up with a "market value"?

Some people go by prices on Ebay as being "market value" and those prices are usually ridiculous. I use Ebay myself but am the first to acknowledge that items often go for more that they should.

If $150 is the "market value" for Ultima II for the Apple, anyone wanna buy mine off me? ;)

Hi Sasa,

I have a spare one. It's the same as the Falcon VGA adaptor, but it accepts an ST color monitor jack. The Falcon has a separate RCA jack on the back to run to your TV (RF signal, channel 2 and 3, or 3 and 4 as I recall).

John Kolak

2349. Atari ST 520 for sale

Newsgroup: comp.sys.atari.st
Date: 1999-07-24 00:00:00 UTC
From: "M.J." <mikej@web-access.net>
Message-ID: <379a94d3.0@news.wcc.net>
Source record: 75411

I have the following for sale:
1. Atari ST 520 Keyboard (has 1 meg ram upgrade) No power supply I lost
it.
2. SC 1224 Colored Monitor
3. Two SF 354 Floppies w/ power supply
4. I have the manuals and some assorted programs like:
VIP Professional Business program
Superbase Professional
Habla Writer
Wishbringer
Degas (art program)
80 diskettes of assorted Shareware programs and backups
A few assorted Atari Books

The 1st reasonable offer gets it all.

Thanks
Mike Jackson
On Ebay my name is Kingnick and I have a excellet rating of a 64 basiclly
meaning I"m good to do business with. All of this stuff worked the last
time I hooked it all up. I"m selling it as is. And I offer a full refund if
you not happy with it after 7 days. Please make best offer.

Paul, you may want to reconsider that choice depending on your final output decisions. A WMF file is a vector file, not bitmap. You can use the TIF files but if you wanted to resize a graphic 1,000% you wouldn't be able to do that with the TIF and retain the resolution. A WMF can be resized infinitely just as a GEM or CVG file can be handled, up to the limits of memory!

Hi,
I'm using METADOS 2.74 in conjunction with SPIN /SD 0.34. This was the
only combination I came across that allowed me to even access my Apple CDROM
drive - and from which the problem arises.
The XFS references bothers me though. As far as I can recall, none was
supplied in the SPIN archive I downloaded. I successfully accessed the CD
drive via MiNT using the XFS that was supplied with the LINKII SCSI s/w as
supplied by ICD. Could you expand on how the SPIN_CD.BOS file I am using
might use a XFS extention.

Thanks.

2354. Nurmix Web Central - Updated

Newsgroup: comp.sys.atari.st
Date: 1999-07-24 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7nbjh0$2pe3@enews3.newsguy.com>
Source record: 75519

I just thought I'd let everyone know that I've been doing a lot of work on my web site recently:

(Nurmix Web Central) http://www.tsotech.com/nurmix/home.htm

There have been some small updates to the Atari section, but in addition to that, the pages on my studio (Red Light 6 Studio) and my electronic music project (NURVIS) have received major updates. And the reason I'm posting it here is because I thought some of my fellow Atarians might want to check out the pages. And yes, it is completely CAB-friendly, as I code all the HTML in QED, and view the results in CAB 2.7 myself.

I've made several song clips of my electronic music available for download (.WAV format) - and of course, it was all sequenced and recorded on my Falcon. And there are also some pictures of my Falcon and studio for your viewing pleasure.

And of course I still have quite a few Atari downloads available (with a lot more on the way soon - including 8-bit stuff). And if you have a warped sense of humor like me, you should enjoy the ZARSISIPAN FILES and DEEP THOUGHTS pages as well.

Anyway, check it out! (if you feel you deserve it) ;^P

-Paul

The proper way to deinstall HDDriver is to load its utility program and use the "deinstall HHDriver" menu item.

If you're having problems getting your drives to boot I advise first switching your Atari on, then once it has booted to the desktop, switch your drives on. Then take your HDDriver master disk and run the prog that is in the AUTO folder. That should log all the connected drives. Then you can run the HDDRiver utility prog and install the booter on whatever drive you like.

In theory there is no need to deinstall any other driver that might be on the drive.

Robert pointed out that some drives can't be booted from (but you could use the prog in the AUTO folder copied to the AUTO folder of another floppy disk and boot from this IIRC), and that CAF needed its own driver anyway. I can't comment further on either of these two scenarios.

On my Mega ST with Lacescan "Megapaint version 6.00 - The Final" ALMOST
works: everything is OK when the horizontal resolution is set to 672
(divisible by 32, that is) BUT the magnifying glass function which creates
a skewed grid on screen.

>>I have heard once that there is, after all, a colour version of Megapaint.
>
>It's possible to assign a different colour to each layer.

In which display mode(s) is this operational? I have tried to use Megapaint 4
in 800x600x16 on a PC with an emulator, but succeeded only in geting the
"Wrong resolution or not monochrome" message.

And how are these layer colours set? Is it under the "Assign print colours"
menu entry? Does this print (?) function affect the screen display also?

>Perhaps a later version was released but I have no knowledge of it I'm
>afraid. Anyone know what the last version was?

The last I know of is the above-mentioned V6.00 -"The Final". Is there
anything after that?

Regards;

Djordje.

True, with HSModem installed, the port can be set up to 230KDTE. Peter
Rotengattler said however that the port would have to be arbatrated to
use it at that speed. I asked what he MiNT by that, but he never
replied. Anyway, mine wouldn't run at 230K DTE.

Hey dude, I sent you a where the hell are you email a couple of months
ago, but didn't get an answer.
I fired up the Amiga today. Looks like one of the hard disk, one with
all the goodies on it, was removed sometime ago. It comes up to the
workbench and there are a lot of disk utilites and a couple of graphic
apps, but all the videotoaster stuff is gone. I don't know if that is
freely available because it needs the hardware or not. That is all I
really want it for. It's pretty quick, but damn, who the hell designed
the O/S? Gimmie MiNT and NAES/Thing/BoxKite ANY DAY! :) Weird shit
there.

Hi Martin,

nope, coz' the font is more than adequate for any decent page. I don't
need excessive scrolling. BTW, I'm using CG Omega 11 or 12 size, I used to
use Verdana 11 before. Good enough as long as there is CONTRAST.
I wanna bet that the body text on his pages has a font size setting too!
>
>>BTW, I just wonder how this site looks like in B&W: probably even crappier
>>than in 24 bit rez! Poor monochrome websurfers :-(
>
>You'd better say poor 24b rez surfers. I'm monochrome it looks good. The
>pictures ofcourse looks awful but the text is very good visible, black
>background, white text.;-)

Actually, I started checking it out myself in mono mode, even with bg
piccies switched off: plain crap. I got a black background and no text at
all, except for the white links (I recall there were two of them on one of
the pages). It means the text is dithered to black here too. So it doesn't
show up. And he definitely issued a BGCOLOR="black" command, he didn't use
tiles, so switching bg piccies off has no effect. Kinda strange that you
get a black background and white letters... but lucky for you! Well,
perhaps that is changeable with CAB's settings for display, dunno. Anyway,
I set up CAB to display to my own liking, which is good enough for any
page, except for the ones created by people not knowing about "contrast".

Talking about "information": did you notice the counter on his page too?
Couldn't make out how many visitors he'd had: the damn' thing continued to
display changing numbers, like a slot machine... :-)

2366. aMail v1.2b

Newsgroup: comp.sys.atari.st
Date: 1999-07-24 00:00:00 UTC
From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7nbom9vn1@news.campuscwix.net>
Source record: 75531

Well, I just upgraded to the latest version of aMail (1.2b)
and I'm having some problems. It logs on to my ISP with no
problems, tells me how many E-mails are there (and size),
downloads them, says the operation was successfully completed,
(complete with bugle/trumpet sound), then nothing. No message
subject ever shows up on the top screen...

Any ideas? Thanks...

Get videlity from the titan/cortex web page.

Not sure if itï¿½s better. I mean the SB software use a smarter gui and
had more feeling for fine tuning.

Both working perfektly. (Falcon)

>At Best Buy I saw a 50pin mini to DB25 cable. Would this work?

Hi Brian!

Yeah, should be fine. Assuming you don't have other hard drives on the
Falcon, you'll need software. HD Driver is the best software for Zips, as
it supports the special options such as password protection of cartridges.

Cheers!

>frames.

I must say after I've posted my complains I upgraded my version to
1.6 pl 2. This version seems to be better. I could resize the window
without the risk of a crash. But still the same problems with some colors.
For instance:
"#D4EBF9" This code give a nice pale blue when viewed with Cab 2.70
and Wensuite 3.12, but with Adamas I get something complete
different. It looks more like "#089394" . Some kind of a
blue-green.
Strange enough when I use "#CCFFFF", which is almost the same
pale blue as "#D4EBF9", the three browsers displays exact the
same pale blue.

and "#F8F7D9" This code give me a nice pale yellow but Adamas shows me a
greenish yellow.

Futhermore Adamas certainly doesn't like progressive JPG. It will
show you the pages but without the pciture. Also Adamas doesn't know a tag
like this: <A TARGET="_blank" HREF="bla_bla.htm"> bla bla</A>.

This one should load the page into a new window but Adamas loads it in the same window as where the links is situated. Wensuite however does understand this tag.

Finaly, it's not quicker the Cab.

Wrong. On my Hades 060 with or without 'copy back' on and with freeMinT
1.15.2b/N_AES 1.2.0/Thing 1.27/NVDI 5.02 etc. Wensuite 3.12 doesn't have any
prob.
Even in 24b color mode it works.
Oke let me do some tests. As test page I use one with three progessive
jpg's. For your information I'm doing this on a Hades 060 equiped with a
Mach 64 4 MB graphic card and with novaVDI 2.67 as card driver.

1) 32b color mode: -Cab 2.70e: Superb. Only it loads progressive jpg's
very slow. This is a know problem.

-Wensuite 3.12b: Picture are displayed in a wrong color
palette: e.g. brown -->blue
blue --->brown
-Adamas 1.16 pl 2: With the test page: Adamas tooks down
the AES (Illegal instruction) and
so the whole system.
With another page with (smaller)
prog. jpg's I got a 'General device
error'. If I click on 'cancel' the
system hangs (even the keyboard). I
played around with the settings but
nothing helped.
A page with normal jpg's and gif's
didn't crash the system but I got
rubbish

2) 24b color mode: -Cab: Superb, same remark as above.
-Wensuite: Good and damned fast.
-Adamas: The same prob as in test 1

3) 16b color mode (64k): -Cab: idem as test 1
-Wensuite: Oke
-Adamas: complete garbage. As Adamas doesn't
understand prog. jpg's I've used
another page.

4) 16b color mode (32K): -Cab: impeccable
-Wensuite: Complete wrong color palette.
-Adamas: Complete garbage again.

5) 256K color mode: -Cab: Excellent
-Wensuite: Damned fast but the pictures are badly
dithered.
-Adamas: slow, some 'BGCOLOR' aren't displayed as I
should be.

Again, on other machines Adamas maybe works but here on my machine it's
more or the less a disaster. Only in 256K color mode it runs reasonable
well.

Simply install HDDRIVER once again according to the manual in this case.
Also note that after installing HDDRIVER AHDI or other drivers are
completely disabled. This is normal for any hard disk driver if it is
installed as a bootable driver: The former driver is automatically
disabled in this case.

Don't forget to remove any harddisk driver you've put in the
AUTO-folder. They don't belong there - and they don't get disabled if
you re-install HDDriver...

Any change that you first have retrieved your mail with popwatch?
If so I think Popwatch marks these mails as readed (of something like
that). If you now download the mails again with Amail then Amail sees
there are mails in the box and retrieves then but as they are marked as
readed (of something like that) Amail will not display then _if_ you've
set in 'global' the 'get' option to *new only*. In the case you've
downloaded your mail with Popwatch before you try with Amail you must set
this option to *all*

Capito?

From: Nima Montaser <nima@canada.com>
Message-ID: <379A5C67.A2F61CD6@canada.com>
Source record: 75415

Hi,
We are bundling one Microtek Scanmaker SCSI X6 + ScanX PRO for the
ultimate low price of $189 US$. The forth mentioned scanner has
been used only for a few hours just to test ScanX with it and insure
full functionality.
Also, you are eligible for a $30 US$ rebate from Microtek. (US & Canada
only)
This bundle will save you about $50 US$ from the cost of ScanX PRO +
the scanner itself, and with the rebate, it is the icing on the cake.

Shipping + applicable taxes are extra.

Anyhow, please contact Homa Systems House for more detail.

Dennis,

I agree that it would be great to be able to use our machines for this project. especially machines like our 1040s that don't get a lot of use at the moment.

The problem is that the project is looking for a one week maximum turnaround of data. It would take a stock 1040 quite a bit longer than that to complete a block of data even if it was dedicated to this task alone.

It would still be nice to participate on our own machines though.

Take care,

Joe Mirando

2385. Woohoo! Woohoo! Woohoo! Woohoo!

From: ad329@james.hwcn.org
Message-ID: <7ne63c$ml7@james.hwcn.org>
Source record: 75418

Yesterday I went to the local goodwill and picked up an NEC Multisync II.
Today I built an interface to hook it up to the ST and "WOOHOO!" it
works perfectly.

It's so neat being able to get all three video modes on a single monitor.
Not to mention how neat it is to play games and work on the larger monitor.
I built an external sound jack into the interface too.

Now I've mothballed the 1040ST I had set up on a monochrome monitor hooked
up to my midi rig and I'm using the Mega 2ST that I used to have hooked
up to a colour monitor.

Now if only I had a real Mega ST keyboard instead of the crappy one that
I hacked together from an old 1040ST keyboard that sometimes works and
sometimes doesn't (when it works and when it doesn't is a complete mystery).
Oh well, one will turn up at the Goodwill eventually.

Oh, and the NEC MS-II cost me a whopping $5. Gotta love it!

Does anyone know of a auto program or some type of program that allows sounds to be replaced in the falcon system. I hate this key click that it makes. If there is anything of the sort please let me know.

Gene

They are only using the Linux kernel. You probably wouldn't know it was
Linux unless someone had told you.

Hi

I use both a PowerMac 6500 and a MEGA STe. I have to constantly shuffle files back and forth - PostScript files that is. I have found that it is much more reliable to create a null modem connection using the Mac's serial port and the ST's serial. The cable should be available in every electronics store.

For software I use Zterm on the Mac side (shareware) and STalker 3 on the ST side. Especially good for large files. And on both computers the transfer takes place in the background so you can do other things while it's going on.

Peter

I remember seeing (and actually having it) an app that will let the Falcon network with the PC through the parallel port using a bi-parallel cable.

Does anyone know the name and maybe where I might get it?

Hmm. I can't get MegaPaint to load ATM, crashes out with the dreaded "Error
69". Used to work!

Seems that the magnifying function is one that reveals any flaws tho', the
version of TouchUp that I have here crashes out when that tool is activated
but is otherwise OK.

>>It's possible to assign a different colour to each layer.

No, it wants to run in mono only.

>And how are these layer colours set? Is it under the "Assign print colours"
>menu entry? Does this print (?) function affect the screen display also?

That's it - you set the print colours as you state, but it doesn't (cannot)
alter the screen display, unforunately :-((

>>afraid. Anyone know what the last version was?
>
>The last I know of is the above-mentioned V6.00 -"The Final". Is there

Message-ID: <8741_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 75429

In uno strano messaggio del 23 Jul 99 saka@village.uunet.be (2:333/608.1)
scrisse al povero Mike De.Petris:

s> I have a question?
s> Could you axplain me once the difference between NOS (your product) and
s> KA9Q?
s> Is there a difference between them?

No, it's just history. This software was born as a Tcp/ip stack for radio
packet users. It is free so many people contributed adding functions and
changing the code, so there were also many names, the main definition is:

NOS = Network Operating System

but the radio packet users called it Ka9q as NOS is not a proper name but a
definition of what it does. There are many variations around mostly for the
PC, the are called JNOS, TNOS, JANOS, WNOS and so on, our is just:

Atari NOS

Atari NOS derived from original Ka9q (see David Nash comments in the
documentation, particularly NOS 0.42. I am now adding, fixing, changing
taking often inspiration from other PC versions, mostly JNOS that is still an
updated project. It is to say that NOS multitasking kernel is mostly the same
between platforms and versions, but other parts are modular and change a lot,
even on the PC you find the "same" NOS compiled with many different
combination of modules. I keep only one version for Atari, as it would be
much more complicated to create each time versions with or without certain
modules. The sources are available anyway, so une can exclude and include to
meet his needs changing the definitions in the project and recompiling.

I've just made some changes, mostly to make my sessions more automatic, it's
still under test here but these are the news:

- nntp bug fixed, posting article worked only if nntp trace>=3

- added multiple serial ports support, specify BIOS number:

```
# if port 0 type dev buff MTU baud
# --- ---- - ---- --- ---- --- -----
# AUX:
#attach asy 1 0 ppp pp0 32767 1500 57600
# modem 2
attach asy 7 0 ppp pp1 32767 1500 38400
# serial 2
attach asy 9 0 ppp pp0 32767 1500 57600
# modem 1
attach asy 6 0 ppp pp2 32767 1500 19200
```

BIOS numbers for port are for a TT, for some reason to investigate
this does not work if you specify the modem1 port as the first device.

- bugfix: domain cache list bombed (ARGV1 instead of ARGV0)

- added domain cache dump to reset cache

- bugfix: this was a very OLD bug, detaching of asy interfaces didn't
work as the asy pointer was not set to NULLIF in st_asy.c

- add http support, new commands:
cab directory <path>: to specify where CAB.APP can be found
cab head <url>: to get header informations on a url
cab get <url> <filename>: to get and url and save it to file !!!
cab start: !!!!!!!!!!!!!! yes this starts the browser ad then you can
navigate, cache is supported, POST is still NOT supported, sorry, no search
engines !

- change in ftp server, directory listing is now unix-like, so
that you can use graphic ftp clients
the change is made to the dir listing routing, so all commands using
the dir() function are affected, i.e. "dir", "ls", etc.

- bugfix: it was impossible to set the INLINE dialing on

- bugfix: telnet to a wrong port passed by name now works
the resolve routine to find the port number can be used
keeping in mind a wrong name makes it return -1, but
fsocket->sin_port is unsigned short

- new SEND command to send strings to any port:
send <host> <port> <strings>...
port can be specified by name as telnet

... so my AUTO.NOS script is:

```
cd d:\nos
source startup.nos
ppp pp0 idle 60 exit
# Next line tells NOS to go ahead and make the connection
inline on
dia pp0 dial.txt
at now+0001 "smtp kick"
at now+0001 "nntp kick"
at now+0001 "ping mail"
at now+0001 "send #### here I send special commands to activate something on
the remote server ####"
smtp kick
nntp kick
ping mail
at
# An example of the send command:
send mail.tin.it smtp HELP "THREE WORDS COMMAND" QUIT
```

2398. [NEW] 2VDI image convertor

Newsgroup: comp.sys.atari.st
Date: 1999-07-25 00:00:00 UTC
From: ptonthat@club-internet.fr
Message-ID: <7nfeqjron1@front5.grolier.fr>
Source record: 75431

Bonjour :)

For GEM game creation or others manipulation of image for Atari compatibles, I coded an image convertor and a .VDI format.
The GFA source is given and it's public domain. the small doku is in the source.

On my homepage at http://www.multimania.org/nef/ or at rajah.atari.org

NB: Joe 1.45 is now on this page, some people made bugreports on MagiC 6.1 so I'll try to release a corrected version (1.45R2) next week.

bye :)

2400. Improving rez for a ST

Newsgroup: comp.sys.atari.st
Date: 1999-07-25 00:00:00 UTC
From: paul_mc@atariste.freeserve.co.uk
Message-ID: <7nev45$k2l$1@news4.svr.pol.co.uk>
Source record: 75433

Hi ,

My ST is all setup now exactly how I want it , except that it all
takes place on a rather dull mono monitor.

What are the options nowadays for improving the graphical capabilitys
of my 4mb STe?

If possible I'd like to combine such an option with an accelerator.

The veloce from TUS looks excellent , I especially like the extra ram
but of course there is no improvement in resolution.

any help would be much appreciated

cheers ,

Paul Mac

Hi Neil again,

well, just checked my 1st page. Nice what this Doctor comes up with!
Only thing is I can't figure out its line count: it gives me line numbers
that don't correspond with my own counting.

Nevertheless, I changed the tables and table setup on both my pages, now I
transfered them to my site and will check a little later again. This one
comes from an official HTML doc, I figure I've done it right this time.
Again, no smileys in CAB, but that isn't proof any longer :-)

And, according to the spell checker, I changed "apologise" into
"apologize" :-)
The nice part was that it suggested to replace "Godfried Cobben" to God
fried... or something. ROTF!

Hohum...!

this second version was adapted from "example" html pages, I seem to
recall from CAB itself...

Checked this one in the Doctor, I had much more "wrong" table commands.
Next I dived into Unix Unleashed, which has a chapter on HTML coding and
found that in CAB's example of tables, lines opening with
end with
, which should be
...

I fixed the stuff again, next is check nr. 3 on my page...

And God fried Cobb en even more :-))))

Hi Gene. Both SAM (the System Audio Manager) and GEMSound will do this, replacing many system events with sounds of your choice...

However, if all you want to do is turn off the keyclick, then you can do that from the X-Control CPX. Drop it down, (it says control panel), then dbl-click the "General" CPX. You'll see a key icon (of the leter C) that you can click to turn keyclicks off and on.

Hope this helps! ;-)

Is there any way to connect my Falcon030 to my AppleTalk ethernet
network?
I've got a Power Mac and an iMac running AppleTalk with File Sharing
enabled on the 'server' - the hub has three ports free and I would love
to get my Falcon connected! ATM I need to keep swaping files across
using zip discs and while this is excellent I would love to get live! :)

So how can I do this? What hardware and software will I need?

Thanks

> ridiculous. I use Ebay myself but am the first to acknowledge that items often go for
> more that they should.

Yeah, eBay can have its "ridiculous" prices (that can happen
anywhere though), but enough Ultima][s have been sold there to
stabilize the prices. $150 is a medium price for the average big box
Ultima][. The later ones go for slightly less and the rare big boxes
(first editions, shrinkwrapped ones, etc.) tend to go for a bit more.

At the moment there are two big boxes on eBay so they might go for
a lower price (which is what you would expect) because the bidders have
a bigger supply to choose from.

> If $150 is the "market value" for Ultima II for the Apple, anyone wanna buy mine off me?
> ;)

Put it up for auction on eBay and see what happens...

One thing, though, don't think your Ultima][will always bring
$150. Auctions can show you an average price, but they never guarantee
a specific price will be reached.

> , which should be
...

The tables are much better, Louis :-)

It's good practice to close all table elements, not just rows. This is
especially important if you get into nested tables.

There are still some problems in your main table. An example row (the
others share the same pattern):

THIN127N.ZIP34.268Dutch resources for Thing 1.27, by Godfried
Cobben

This should be written as:

THIN127N.ZIP34.268Dutch resources for Thing
1.27, by Godfried Cobben

Here the value of attribute "HREF" for element was enclosed in
quotes, and the closing anchor tag was added.

One step further, use of the FONT tag to define a size of "3" is
redundant in this case, since that's your default anyway. Also, defining
different font sizes -- and other font attributes -- in table cells
requires that each new cell begin with its own FONT tag, otherwise most
browsers will ignore what styling was defined in the previous cell,
using defaults instead.

So, all things considered, your table row should look like this:

THIN127N.ZIP34.268Dutch resources for
Thing 1.27, by Godfried Cobben

One other table needs some work:

This page was created by Web Page Creator
2.0
.... at least, it assisted in the main items ! © Rob
Mahlert

Delete the rowspan attribute -- it's not needed since there's only one row.

Add the TR tag.

Close all tags: Here you've got two cells defined but close only one of them.

Correct the closing tag.

Enclose attribute values that use special characters in quotes (e.g. "100%", "#FF0000").

So, all things considered, your table should look like this:

This page was created by Web Page
Creator 2.0
.... at least, it assisted in the main items ! © Rob
Mahlert

I'm not sure I understand what you're saying.

There existed an Atari program -- can't remember the name of it -- that dumped the contents of your screen to a text file. For instance, let's say you're running a program and have text on your screen that can't otherwise be saved (no buffer or other copying facilities). This special program, summoned via a key-combination, dumped whatever system text was on your screen directly to a text file. The only requirement was that the default system font (the one in ROM) had to be in use.

> Lets say I am viewing a .GIF picture that has quite abit of text in
> it with a program such as ImageCopy or TruePaint.
> I would like to be able to cut out just the text in the Image and
> save it as a ASCII file. A ACCessory that would do this would be great
> or at least I could make good use of it.
> However, being able to do this with Cab is also useful.

This is asking too much. If the graphical text is consistent, you could use OCR to do the conversions. When I say OCR, I mean Alexander Clauss' wonderful program. (It's better than the commercial OCR package that Migraph used to sell.)

Some time ago I needed to dump the contents of various screens to text files. The special program I mentioned wouldn't run on the TT, plus I was using the Monaco system font anyway, so the only way I could do this was to do screen grabs, then train OCR to convert the images to text. Afterwards, using a saved OCR font library specific to Monaco, I could easily convert any screen grab containing system text.

I have one, had it working on my TT many moons ago. I don't know that I can put my hands on the software that easily, or at least the latest drivers. The Supercharger emulates a 286 at best if I remember correctly. I had Windows 286 running on it but never tried Windows 3.11

> Please reply to e-mail if possible and don't flame me too badly ;)

Randy,

I'm not using Linux... yet.

I've got a 366 MHz Pentium II running <gack> WIN '98.

It completes a block of data in about 18 hours, give or take.

I'm looking at Linux carefully at the moment, but baby steps are the key for me right now... Dealing with all the little Intel/Microsoft idiosyncrasies is enough for the time being. <G>

There is no Atari version of SETI@home, if that's why you were asking about taking the ST out of the closet. But there's always a chance. The ST is still good for lots of things, including internet work. I still prefer CAB (the most popular Atari browser) to either Communicator or Explorer. Sometimes less really IS more. The bells and whistles that Netscape and Microsoft provide are nice, but they don't really add a lot of functionality for me.

But, then again, sometimes MORE is more.... CAB's modules are a BIG help. Being able to view, copy, and move entire 'folders' of web pages, automatically block advertisements, and encrypt messages into HTML code are all nice touches that add functionality for me.

By the way, my TT still gets a daily workout, so this PeeCee can take a breather and get over itself. <g>

Take care,

Joe Mirando

Try using the CAB.OVL that comes with 2.7. I've found that it does a
better job of supporting cookies than Dan Ackerman's version. And
I've had very little luck at all with Olivier Booklage's, as far as
cookies are concerned. I've found several sites that I can't get to
with anything other than CAB's own CAB.OVL. (Unfortunately, there
are many sites I still can't get to, for one reason or another.)

Of course, you'll need to use I-Connect with the CAB.OVL that comes
with CAB, as STinG/STiK won't work with it.

You know Kevin, I think that there are a lot of lukers in this group. Domains and email ID's I have never seen come up at the strangest of times:). I know most here, at least by their posting, but advertise one thing for sale way less than what it is worth, and I get replys from people that have never posted here. I guess it's like garage sales, you have people that buy things at bargin prices, and try to sell them somewhere else to make a living. Hell, I thought this place was for fun?:).
Hey, sell it for what you think it's worth. Anyone want an Atari Falcon 040/Afterburner/Nemesis/Expose/Wizztronics Rack/dual 6gig IDE's/EZ135/Cyberdirve 24X SCSI CDROM/Yamaha 4x4 CDWR/NOVA-ATI Mach 64 for $5000.00?

On second thought, it's not for sale:)

Mike

I think I got Jaguar at about the same time (I can't even remember it seems
so long ago!) I never play it anymore. Even before I had the N64 I used
the PC for most of my gaming. Jag games are just too expensive and they
aren't even that good. It just isn't worth it...I buy N64 games now.

Frank,

your comment is extremely confusing. What do you mean by "integration"
into the kernel, if we are not talking about a larger mint.prg? MiNT
currently has loadable devices, which are already used for MiNTNet.
MiNT also has loadable filesystems, which are used for NFS. The only
missing part is a way to enable sharing of the socket library, correct?

> >
> > Chris

This is a weird situation. I've just tried the demo, and for me it works
with virtual memory on, but not with it off. And Ash claim (in an e-mail
to me) that it works with virtual memory off. MM 2.1.5 with OS 8.5 or
8.6 shows the same behaviour - ok with VM on (or with Ram Doubler on)
not with VM off.

The erro message IIRC is "not enough system memory for ST-RAM" - but if
one starts with extensions off, one doesn't get that message, just a
crash which forces a restart of the computer.

My machine is a Power Tower Pro - a clone. When I first installed MM it
said something about not being able toaccess a certain address. Whatever
that was about I've never had any trouble with MM except for this issue,
which I would like to solve.

In a former life as an exotic dancer, sandcat@ridgenet.net (Mikey) wrote:

> Is the Nemesis grounded to the rail the runs on the outside edge of the
motherboard with leads coming from the "e" pads on the Nemesis?

It couldn't get much more grounded if I attached it to a copper pipe in the earth ;) My falcon is tower cased, so I've got plenty of room and went for the "hang it off the eartch strip at the front edge using several lengths of paperclip" approach. I think I made 4, maybe 5 connections.

> Are you sure the oscillator in the second socket is making good contact?

Yes, I double checked that as one of the first tests after I got the low speed working but not the higher one.

> Did you try different caps, or even a resistor (~75-100 Ohm) for the DMA
mod?

I honestly can't remember. I've been installing it in fits and spurts for about a year now! If it was suggested in the manual, I probably tried it, but I'll double check that just in case. What's the best recommendation here?

> If you have an FPU, is the clock in pin (you'll never find the trace:)
for the 68882 line seperated from the motherboard and fed by its own wire
either from the Nemesis (bad idea) or with its own oscillator?

I pulled the FPU before starting the installation, as it's only a 16MHz one. I had intended to get a faster one once the main Nemesis was working.

> Is this one of the "new" 50 mhz Nemesis or the older "48Mhz" version?
A lot of users have had problems with the new units, at least as far as the documentation goes concerning traces that should (must?) me modified on the newer versions.

It's the "new" one. Which bit causes confusion? I followed the manual okay, though admittedly I did have to read it a couple of times (and write extra notes, etc. on it) before I started. I'm 99% certain that I've done everything the way they intended, but if you can point me to the source of the confusion, I'll double check my interpretation.

Thanks for the help. Whilst I'm sure it can be made to work with enough effort, if I don't get it going soon, I'm giving up one it. While I keep working on it, I can't practially set the Falcon up so that I can _use_ it. I'd rather be using a less than perfect one, than letting it gather dust while I continually try to fix it ;)

Message-ID: <379BF7E5.69B4@geocities.com>
Source record: 75462

[Been trying for FOUR DAYS to get this question out. After rebuilding my desktop and re-installing my browser software... I'm back!][This was on the Macintosh... which till now had worked fine.]

Recently went and bought CAB 2.7 from Systems for Tomorrow, and the installation went great. It reminded me of the easy install applications of the Macintosh world.

I've noticed many improvements with CAB 2.7 over 1.5.. :) and even my
PC oriented brother-in-law was impressed that the Atari could surf the internet as well as it does.

But I noticed a problem when I started trying to access "Atari Advantage" on Delphi and check my E-mail (HTML/website based) on Yahoo. In both cases I would enter my name and password, and in both cases, the information was "redirected". At which point it would give me the option to "get this", "repost" or "cancel".

I found out that my browser was not accepting cookies. So what I did
was change the browser so that it would accept cookies. (option in CAB).

I also tried to update my system clock to current (or as much as current with my 1040 STE without battery backup), and made sure I had CAB.OVL 1.3016, which is the latest overlay and was the one that came with Cab 2.7.

Dispite all this, I am still not able to convince these websites that
my browser accepts cookies. I am curious what else I can try?

Thanks in advance,

Doctor Clu

PS: Just to give you some more info....

System:

Atari 1040STE with 2 megs of ram (confirmed)
(Installed 2 more megs of ram but I'm not sure if they are working. Anyone know of a program to test system ram?)

Single TOS running latest version of STIK from anthill productions website.

Then this is the wrong newsgroup. You should look at
comp.sys.atari.8bit. This group is for the ST/Falcon/TT/etc... series.

You want PARCP or Paralink. Both need a special cable to be built. It's
a straight parallel cable with 2 wires crossed over, you can build it
yourself or get it built.

> Is there any better? something
> with a GUI.

Parcp has a "Norton Commander for MS-DOS" type of GUI, which is better
that nothing. I don't know about Paralink, as I never got it to run.

If you can go with serial port speed, then try Ghostlink, which "mounts"
the PC to the ST's desktop, just like a normal drive.

> Also, what are the best ST FTP download sites? A 2 hour search

There is no such thing as a newsgroup administrator on non-moderated
groups such as this one. Usenet is a completely decentralized system, so
if there is anything wrong it is probably a misconfiguration either in
your newsreading software or your news server.

There aren't really any modern practical solutions for this. You could adapt an old Mega ST video board, but this will be a lot of hacking, and a lot of trouble just finding such a board. ST high-res is quite comfortable to work with IMO.

Greetings fellow Atari or possibly Ex-Atari users such as myself. I am curious about
the process times for the project. I remember my ST would fly if the software was
written correctly. Is everyone using Linux yet? Just checking because i use a P233mmx
and under NT it takes approx. 48 hours to process 1 field but under Linux the time is
reduced to about 24 hours.

I still have the ST in the closet, should I plug it in too?

Please reply to e-mail if possible and don't flame me too badly ;)

randy.

I want a wp program which will run on an STE with a colour monitor. Hopefully, one which will read MS Word files but I'm not too optimistic on that point. I have a 300 page thesis written in the eighties on 1st Word plus which I want to rework. Using 1st Word + after about seven years using Wordperfect and Word for Windows makes me wonder how I did it on a program as crude as Ist Word. I would like to use the old Atari on this project (don't ask me why. Nuts I suppose) but I need a modern ST WP program. Any ideas where I can find such a thing? What are peoples opinions on the various WP programs around? Will I need to find a mono monitor somewhere?

Oh, and another thing. The monitor I have has a switch on the back which allows it to change modes from RGB to green screen and some sort of monochrome video mode. Is there anyway I could run the ST in hi-rez through it?

Have done so a long time ago, but that didn't prevent MagiC from
corrupting my Thing-folder several times this weekend. I'm usually
running MiNT+N.AES on this TT (networked with my Falcon), but I've been
running MagiC now for a few days since I'm debugging Taskbar. Every
time I tried to boot MiNT+N.AES after having used MagiC, Thing was
corrupted. Odd...

Papyrus reads Word files, but I'm not sure if it runs in med-res.

Papyrus is said to be the best one around. The problem will be
availability, depending on where in the world you live.

A mono monitor definitely makes things like WP more comfortable.

> Oh, and another thing. The monitor I have has a switch on the back which
> allows it to change modes from RGB to green screen and some sort of

What type of monitor is it ? You probably won't lose much by trying to
toggle that switch and rebooting.

Sure, at 160*100:).
The best my Falcon can manage is about 12fps at 320*240 using Expose.
This is not a stock Falcon. If you have a high quality VCR, and a Falcon
of reasonable speed, you can playback at 1/2 speed and the Expose will
keep up fairly well. There is no timebase, so editing of duplicate
frames is necessary. If you don't have fast ram, you'll probably not
make it even at half speed, and if you only have 14mb or ST RAM, you
won't get much video. Playback is another thing.

Hi just a note on the use of white text on a black background -- it's sometimes, if not always, impossible to print out such on Netscape, even by 'using my own colours' option, the preview and printed sheet are just blank! The message is please don't think of just the instant visual impact, but also of the hard copier. I haven't tried downloading the page at home on my CAB 2.7 Falcon, combo, but have saved a hell of a lot of time by using the 'autosurf' module in CAB and viewing off-line, espec. for pages found to be very graphic on Netscape and therefor slow on CAB, real-time.

It's been awhile but I've got out my atari 800. I can't remember what to do. I have a problem when I put a disk in the 810 disk drive nothing happens the screen just stays on atari memo pad. I can't remember if I have to have a cartgrige in the comp. to play a game. the only cartrige i have is atari word and when I put it in a get a list of options, I try pressing the load option of the index of files to try and see if it will get my game from the disk drive but it always says device not ready. I wonder if the parallell cord is bad between my comp. and disk drive. There are two places to plug this cord in on the disk drive. I believe I've tried both ones and still same results. Well that should give you the just of what's going on. Any ideas out there?

2457. Re: simple question about my atari 800

Newsgroup: comp.sys.atari.st
Date: 1999-07-26 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <379C8FDA.1F06@geocities.com>
Source record: 75480

Welcome back to the Atari world! I personally love the Atari 8-bit
scene, and probably when things slow down on the ST scene I'll got back
to making the 8-bit Ataris (in particular the 800) my hobby machine.
But for now I'm shooting for a TT or Milan. :)

As for that 800... the only question I'd have would be the following:

1) Is your drive drive spinning up or lighting up? The drive
seems to be the major issue since your computer SEEMS to be
fine. See if your drive is powering up alright and that
you have it properly connected and we can take it from there.

2) Do you have a DOS disk in the disk drive? For about 95% of
Atari 8-bit software that's dick related, the DOS is on the
disk. The way you will know the computer notices the drive
but there is no seeable disk by the Atari OS is you will
get a "boot error".

Again, welcome back, and check out the exclusive 8-bit newsgroup as
well...

Fellow Atarians, lend me your ears!

Especially those musical loving ears. I have found some websites out there that seem to know all about Amiga, Acorn, Macintosh, and PC having MODplayers, MidiPlayers, and so forth.

But no Atari! Blastphemy!! :)

So, please, in this thread, place the URL of all music and MOD related players and I will get the word out to all websites I run into and make the Atari name known! This goes for both ST and 8bit Atari.

Thanks!

Doctor Clu

Hi Greg. Can't help with the cookies but Ram is easy to check. I'm assuming you are using X-Control, right? Just goto the control panel, drop it down, pick the "General" CPX, and then click on Status. It will show you various things, including Free ST Ram and TOS version.

Later... ;-)

Not so sure about URL's, but geez, there are a kazillion and 1 (anybody ever truly define this number yet? <grin>) MOD players for Atari ST's, STe's and the Falcon...try any of the popular ftp sites or the CD-ROM collections.

Oh, here is one:

http://www.astrasoft.ml.org/

This is a very cool MOD player that works on just about any TOS machine. Only problem I have with it is that it doesn't like the Audio.dev under MiNT... Other than that, I really like it. ;-)

I use it in my studio, with an ST plugged into it running Cubase...it works, after a couple of hours reading the manuals you'll prolly never need them again...one word of warning...you want a gigantic hard-drive....I've got a 4Gb 3.5" unit crammed into my standard case using an ASP IDE_Burster (Shameless plug there...I am ASP)...that gives me a load of 500Mb partitions to use as <Tape>....you have to install tape files into partitions that you want to use for recording and they pretty much take over the whole partition...recording is easy, effex and mix-down are easy, it syncs to MIDI, it uses external clock happily, though as it also does very good sample-rate conversion you xcan always record at 50 kHz, mix etc at 50kHz and then convert the final file to 44kHz for pputting onto CD...that's what I've done, though as 44kHz clocks are cheap now I might invest in one....it would only ever pick up my Clarity 16 dongle as 48kHz...works well...looks good,

chrisc

Well, I can get NVDI to print simply by putting the MACPRN.SYS as device 21. Calamus would not print until I downloaded the demo of SL99 and MacPrint. Now it prints but I have to spend 100DM on MacPrint and about 600DM to upgrade my SL98 to include all the modules I now have and paid for from MGI/DMC. Is it time to migrate completely to Illustrator and for that matter, Office 98 on my Mac?????

Hi,

> Cubase audio falcon wanted. Any clues???

Since many have made a sidegrade to VST for Mac or PC (I'm sorry to
say...) and by doing so, they've traded in their Atari version, CAF
should be available without any problems from your retailer or national
distributor.

$ 4.00 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on weight/distance. Large orders will be weighed as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

It's not good, but it is right.

AC14 is currently at the printers and should be dispatched to all our
subscribers within the next couple of weeks.

Have to agree with you :-) I only use it for playing back MIDI-files
though, as it's the only piece of software I've found that's capable of
playing MIDI-files in the background under MiNT/N.AES or MagiC.

Experiencing a small annoying problem with postings from a Atari User
in CSAST.

When Using Newsie to get a OverView of CSAST, sometimes I'll fetch a
few postings while in the Overview mode while Online.
This works fine except for one persons postings, If I grab a posting
from this person while in Overview mode, then go ahead and download
all the available news in CSAST, This persons posting that I just took
a quick look at will not be downloaded. This happens all the time but
only with this persons postings. This Guy is using Atari software and
Hardware AFAIK. I'm not trying to start trouble or offend anyone but it
is a small annoying problem. I think this also causes Newsie to hang
when downloading News from CSAST. It's like Newsie is trying to get a
posting but it isn't there anymore if I take a look at it first in
OverView Mode. And this only happens with one persons postings.
Works fine with everyone elses.

Has anyone else noticed this?

Anyone know why this happens?

phantomm@kih.net

Hi Phantomm,

just wildguessing, but any chance "this guy's" somewhere in a killfilter?

You can't check that right now, but if you state from whom these items are
we might check on his software... The headers should state at least what
s/w he's using.

Hi Louis,

No I don't have anyone in a killfile and have never used a killfile before, be lucky and never had to I guess.

I almost sure the person is using Newsie also. So maybe its a bug or something.

But it is abit strange, when requesing to view the article posted while in Overview I do get the posting. But when I go back to download all the News, The article from the person that I viewed is now gone. Only seems to happen with that one person.

2486. Eureka : 2D Graph Describer 3D Modeller

Newsgroup: comp.sys.atari.st
Date: 1999-07-27 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <379D77C1.F8145FAE@ief.u-psud.fr>
Source record: 75369

Hello Everyone,

I placed on my home page the August revision of Eureka software.
Eureka is useful to design all sorts of mathematical shapes.
In 2 dimentions (plane) you can plot graphs, and do some numerical
analysis on series, sounds, images, fractals. In 3 dimesions (space)
it is a modeller that allows to design shapes. In 3D, many
export formats are allowed, from vectorial graphical formats,
to 3D image synthesis like Persistence Of Vision, and Virtual
Reality Modeling Language (VRML). There's also
animated shapes thanks to a "time" parameter extending
to 4D evolutive shapes. These object animations have
an equivalent in POV script format. Some examples can
be found on my home page.

Eureka is a complete package, including attached
programs and accessories that have been tested
on many ATARI platforms also including MAGIC, clones etc ...
It is a shareware, but has no limitation in its use.
I expect some feedback from you. It has a French
and English documentation and ressources. It
use MESA 3D (OPEN/GL clone by Brian Paul) to
render. I would eventually need you help to
extend the documentation, taking account of your
own experience. It is distributed under Cyberstrider
scheme.

So any comment would be welcome ... You can
also find the program on RMA ftp site at
ftp://chapelie.rma.ac.be on mathematics
folder.

Regards,

I couldn't agree more. Why do people buy a 450MHz PC just to read
mail or write the odd letter. It's like buying a McLaren F1 just
to do the shopping with. Fine, if you are trying to impress
someone but is it really necessary ?

A Milan40 or Falcon CT2 is fast enough and capable enough for
99% of users and 99% of uses.

2493. PCMCIA memory cards on Atari?

Newsgroup: comp.sys.atari.st
Date: 1999-07-27 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <379DFE5F.C91@geocities.com>
Source record: 75376

I just got through replacing a cabinet on the club's hard drive. Good old 45 meg hard drive. You know, it was the 1990-1996 era of hard drives that I learned to loath. I think for that reason even the most recent hard drives, which are more reliable and tend to last longer, are still on my loathing list.

Thus the reason why when I looked at a PCMCIA card laying around (granted only 10 meg) I looked at it and said... hmmm..

You have a computer where the operating system is ROM based. Make the memory FlashRam based... and you have a dream machine in my book!

So... I know on the PC you can add a PCMCIA card drive and it acts like another disk drive. Has anyone tried getting one of these card docks to work on the Atari ST platform?

Thanks in advance!

Hi Peter,

agreed and not agreed: I've got a TT, which for most use is fast enough. Except for graphics: it's simply slow. Like I said a little earlier, a Falcon is probably better because of the DSP.

For text editting, processing, lotsa stuff it's more than good enough. Even Internetting. Again, here with webbrowsing the graphics slow stuff down. But I can live with that.

Now I bought a P=III 450 MHz too: not to do the average wordprocessing etc, I have a TT for that. BTW, if one can buy a 450 MHz one why would one buy slower? The bloody MS stuff is inefficient, my TT beats a P-133 on booting alone. Well, again, graphics is another story.

This new PC is destined to run Linux. Know that? Run X11 on a slow machine, you know what I mean. So I deliberately choose for a 450 MHz type plus plenty of RAM, 128 megs for now. You know what adding RAM to a MS bunch means, don't you? On my TT it makes no difference, except for that my 64 megs are faster types than the old 16 megs. Split-second work. But the idea is to exploit multitasking fully on that machine. So I need power and RAM, that's for sure.

But again, there's limits: I could buy a 500 MHz type for another 300 bucks or a 550 type for another 600 or so... No thanks.

Haven't got the exact same problem as I'm using (*whisper mode ON*) a PC,
but I have noticed over the last few days several postings which are coming
in with the body replaced by:

"This article was probably generated by a buggy news reader."

Don't know if this message is created by OE or by the news server.

I thought it was just affecting one person, but the same has happened to
another poster today. Unifying factor is they are posting from CIX using
CIXread/CIXcomm. In one message, if you examine the source, part of the
message has been mixed up with the header, which may be part of the problem.

Has this software been updated recently and is producing duff messages? Or
have CIX changed something to stop it working? This has only started to
happen in the past few days.

I have found a copy of Express Letter Processor for the Atari 520ST. I have no way to test it, so I am offering it to anyone who wants it. All I ask is the cost of shipping from NY. The manual is a little water stained. Email me if you want it.

Thanks, Jack

Unless your PC software is really old, a SuperCharger won't help you. The first version was PC-XT. I don't know about later ones, but I seem to remember a 286 version.

With any luck, you can get an entire working 386 system for $50.00 at a garage sale. It will work better than any plug-in emulator that I've seen. I even recently came across a complete Acer system with a Pentium CPU for $50.00. I don't like Windows, but I've never been very satisfied with any type of emulation software/hardware either.

Mark,

Don't you remember what your mother told you??? ..."Don't advertise it if you don't have enough for everyone".

Well... DO YOU?? <LOL>

Sounds like a kickin' setup. I'll be very interested to hear about how long it takes to complete a block of data.

Betcha that K6 would run GEMulator pretty well too. <g>

Take care,

Joe Mirando

Thanks for the info John.

I have also noticed a few postings with the message you mentioned.
Maybe the problem I am having has something to do with the News Server that the
person is using.

I'll just avoid looking at the guys postings until I have downloaded
all the News. That will be the easiest fix. But I do enjoy reading
some postings while online. ;)

Anyone who would like to read an article on classic computers, please click the address below. The editor was looking for an alternative to writing with an IBM/Mac. So, being a writer, and a fan of classic computers, I felt it might be interesting to submit an article about classic computers. He liked the idea, so I have written an article titled "Powerful writing on a limited budget!". I hope it is of interest to everyone. It is not too detailed, because the idea was to present an "alternative" and not get too technical.

I hope you enjoy.
Sincerely,
Michael A. martin

ttp://www.icwhen.com/index1.html but then you need a little more info:

go to "site features"

go to "ic news"

we're listed down the page a bit "swap & sale, Columbus, Ohio"

The Atari Computer Enthusiasts of Columbus are pleased to announce their next annual swap to be held 9 a.m. to 3 p.m. September 18, 1999, at the Oakland Park Community Center in Columbus, OHIO, USA. Sellers of any type (commercial vendor or private) may obtain tables at $5 each, and each $5 table fee will also admit one person (sorry, if no extra person in your party, the table is still $5 ... after all, folks, we're trying to keep this thing going, ya know). Otherwise, it is a $3 admission per person.

A .bmp map will be available from rwarenz@infinet.com.

The new version is a better one than V5.4 :-)

At last I put in the few special 040 & 060 instructions.

new since 5.3: (Forget V5.4 That one was a bit premature :-)
Marking of jumptables for label generating.
Find jmp's and jsr's with indirect operand.
Give names to absolute word addresses.
Options in the config file related to the above.
Give names to standard labels.
Attach a short comment to an address.
More flexible index file.
At last! Full 68040 & 68060 support.

Visit my web site:
http://people.A2000.nl/hrobbers/Homepage.html

Met vriendelijke groeten
Regards.
Henk Robbers.

My Supercharger was also Nec V-20 or V-30. A 286 hack was done by the
southern Calif importer, and a 386 vaporware was supposedly under
development, but never saw the light of day. The only TT compatible
hardware emulator. Only did CGA or herc mono though. You might be better
off with soft PC.

Hi,
Yeah, had another look in the SPIN archive and there it was! Works a
treat too. My only grumble now is that in order to have a dual-booting
system (TOS & MagiC) both METADOS and METAXBS need to be in the auto folder
and depending which OS I require with the CDROM, one METAxxx manually
disabled. Shouldn't grumble though :) Thanks.

Later.

What version of MagicMac are you using? This doesn't work with MM 2.1.5
or with the demo of MM6, as far as my setup is concerned.

That might perhaps be expected. Ash seemed to be saying, in their
message to me, that I would need version 6, so your suggestion may well
not work on 2.1.5. And quite possibly the settings aren't saved in the
demo version. Even so, Ash could have mentioned this (or is it mentioned
in the manual?).

It's a clock that adds sample frequencies to the Falcon's DSP. Without
it, the Falcon is limited to a 49 KHz sampling rate, which is nice, but
not compatible with industry standards (CDs, etc...). The CAC adds a
44.1 KHz sample rate, which is the same as audio CDs, and used
throughout the music industry.

Can I make a plee for every one to make their country clear some where in their postings, espec. those offering for sale or wanting to buy. I put out a request for an SM124 to Falcon adapter and got a very helpful reply. I asked how much and was told the answer in $. US, Canada, certainly not UK. A bit nit-picking I know, but I think this point has been raised before. My office address and home address rking@zetnet.co.uk, both show UK and some of the US addresses show the State, but this is rare.

Bob-King.

Congrats. on a very interesting article. I used an 800XL and then 130XE
at work for writing all my reports using a PD (not the commercial
version) program called Textpro. It was very, very powerful, very much
like Protext in feel - command driven. I have never seen it referred to
elsewhere. My work output was also on an 8-bit PD database program.
For 3 years I was the only patent examiner using a computer for day to
day use and it was an Atari!!!!!!
The ease with which I could set up a question and answer type template
in Protext and print straight onto our pre-printed forms was the envy of
all. What a wonderful program.
When we were first PC'd, I went over to Protext 4.3 on the PC and First
Choice (for the data base) and this was purely for the better display.
Now we are all using Windows NT, WordPerfect, Netscape etc etc and its
soooooo dull!!!

Bob King

Well, I've seen 2 4meg Falcons for sale around that price in the past year
or so, and I bought them both!
Normally, its like £300 for a Falcon, so if I were you grab it!

Simon

I have an original ATARI SF314 external, the power supply has these
values: 5V 0.72A and 12V 0.21A and yes, they're standard PC drives,
I've changed mine to a 1.44MB (Sony, Epson and others are OK).

2524. Multiple booting

Newsgroup: comp.sys.atari.st
Date: 1999-07-28 00:00:00 UTC
From: Henk Robbers <H.Robbers@cable.A2000.nl>
Message-ID: <379EF8A1.38E469E0@cable.A2000.nl>
Source record: 75310

Hi,

I have on my TT 4 autofolders.
1: AUTO.TM TOS on TTM194
2: AUTO.TC TOS on NEC3D via NOVA card
3: AUTO.MM Magic on TTM194
4: AUTO.MC Magic on NEC3D via NOVA card

Each autofolder contains its own CPX folder and its own set of programs and inf files.
I devised a little TTP program that accepts a autofolder name by dropping on its
icon. This name must have one of the above extensions. That determines what
it is gonna be. The current autofolder (no extension) is renemed to what
it was before, then the passed autofolder is changed to AUTO.
Each autofolder has a information to determine its original extension and its
validity.
The program is also able to change the name of the NVDISYS folder.
So changing set up is only 2 actions: dropping the autofolder and do a cold start.

If anybody interested, I can put the source (Pure C) on my homepage.
(The program is so small, its easier to change it and recompile, than write
cumbersome configuration stuff. :-)

> Bye, Alfons

I remember this game it was called "Stunt Car Racer" where
you drove round a raised circus type track with jumps and
loop the loops etc. This was a great game where you raced
against your computer or could play multiplayer via a null
modem connection with another ST. Fantastic. Unfortunately
I have recently given away my ST and all my games , still
it's nice to reminisce. If I can get hold of a copy I'll
let you know.

> agreed and not agreed: I've got a TT, which for most use is fast enough.
> Except for graphics: it's simply slow. Like I said a little earlier, a
> Falcon is probably better because of the DSP.

Not really. As the experience with the Brainstorm JPEG decoder
prooves, the DSP alone doesn't make much of a difference, _BUT_
a combination of DSP _and_ FPU might make a slight difference.

Pitty the Falcon doesn't include the FPU by standard and most
users are procrastinating the upgrade too...

2527. GT5000 scanner. Connection cables?

Newsgroup: comp.sys.atari.st
Date: 1999-07-28 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <379F0F93.A7827E5D@patent.gov.uk>
Source record: 75313

I will be getting a GT5000 scanner for my Falcon very soon. It is from an ex Atarian, now Power Mac. bod, who is giving me horrendous tales about the need to use the correct SCSI2 cable, SCSI input/output boxes, etc, 'otherwise the interference will be too much for the scanner to work'. I know some of you have GT5000s, so what connection problems are there? I already use a SCSI2 to 50 way block ribbon cable connector lead for my CD ROM, wont want to daisy chain the CD ROM and scanner and have a spare ribbon cable connector of the above type. This of course is not shielded, so I assume I will have to buy one. The scanner is as new at ï¿½50, so I can afford a bit on cables!! I will use GTLOOK 2.

Bob-King

I just had a piece of bailing wire connected. :)
Really, I have an ES1200 and use GTLOOK2. I have had no problems using a normal (50 pin centeronics) out the back of my last SCSI device. The scanner is 5th in the chain.

Hello everyone!

I bought an old Atari 1040 STE for peanuts, because I found that some
midi
software was very fun to use. I would also
like to code something on it, so I was wondering if anyone could help me
to
find a C compiler for this machine. Are there free C compilers for
Atari?
Have you got some basic libraries with it? (graphics, standard runtime
library... and so on.) Documentation ....

I would be very happy, if someone could help me.

Thank you very much, in advance

Balog Jozsef.

GCC is available for the Atari, but the most popular C flavour is Pure C
which is commercial.
Have a look at any of the Atari FTP servers.

HiSoft C is actually an interpreter, so it's not very useful. You're
probably thinking of Lattice C (which indeed has rather good, but outdated
manuals.).

Hello Martin, I am afraid I don't understand..
To load a JPG picture of 100Kb (average compression of 75%) to display in
TC color takes less than 4 sec on falcon using the DSP.
I don't think using CPU only will be that fast, but again, last time I
used a TT was 3 years ago. So.. I might be wrong, but it felt MUCH slower.
I think we should take 1 picture (the same) and we time it.

I still haven't sold this stuff.. and I noticed a few people are asking about some of this gear, so I am willing to part this stuff out. See the urls below for more info if you're interested. Reserve is very fair, but if reserve is not met I may still sell to high bidder.

-Steinberg (SoundPool) FDI, Falcon Digital Interface.. this one has been upgraded to greater then 16 bit capability.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138493756

-SoundPool ADAT interface.. allows transferring audio to/from ADAT to Falcon.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138498464

-Steinberg ST-MIDI 3.. adds 3 MIDI outputs and 1 MIDI input to Falcon.. useable only with MROS programs (like Cubase Audio Falcon)... $100
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138503090

-Cubase Audio Falcon.. with dongle, CAC (clock), manuals, etc.. I also have the Studio Module, Cue Trax, Style Trax package that I found invaluable..
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138507447

I will also sell the entire package above for a good package price if you're interested..

I will have a 14 meg Falcon for sale, with Screenblaster II, NVDI 3, HDDRiver 5, VGA adapter, tos 4.04, Diamond Edge/Back, etc when I get my jaz drives cleared and copied to my Mac.. make offer if you're interested.

Btw. I never succeeded running Megapaint in MultiTOS-like environment
(TOS+MiNT+AES4.1). In Magic and N.AES/Thing it is willing to work
in "single" mode. Any suggestions how to make it run with AES4.1?

>>The last I know of is the above-mentioned V6.00 -"The Final". Is there
>>anything after that?
>
>Mine is 4.00.
>
>If anyone has a copy of V6.00 (preferably in English) I would be pleased to
>hear from them. It's a great prog.

As far as I can notice there is no practically no difference between
V4 and V6- except that V6 is (almost) willing to work with overscan
and the docs say the way some functions operate has been slightly changed.
But I did not see any difference.

And wherever I have asked, no-one used an English-language V6 (has anyuone
seen versions 3 or 5, or have just the even-numbered ones been released?)

I have a very Good Atari STE TOS 1.62 with 4Megs and a Atari MegaFile
30 Hard Drive System For Sale.

If you are interested in purchasing a Good working STE, then
e-mail me and I'll send you the details on the complete system
with Price.

I wouldn't sell this system, but with the other Atari Machines
I have up, I just don't have the room for this one anymore.
If interested contact me at:
phantomm@kih.net

Thanks for that Peter, .vga and .eps are the ones in my assygn.sys file.

>Don't blame me if it all goes horribly wrong, it is ages since I did

No way otherwise no one would ever offer advice! I always back up
every file that could be remotely connected to any changes I do before
going ahead so if it goes wrong and can't be sorted its my fault.

Nice article, nice page, nice site!

The New York Times recently did a feature on classic computers and focused on the C=64. If Atari was mentioned at all, I missed it, although I scanned for it. They should have seen your article first!

Hmm, my Lattice 5.6 contains 3 manuals in the big box with up to Falcon
TOS support plus another book called 'Modern Atari System Software' which
covers the DSP, Atari's MiNT, AES 4.0, SpeedoGDOS etc. Not exactly up to
date but sure not so outdated :-) Still use them as a reference since
Pure C's manuals are in German.

2549. Help the Thalion Webshrine!

Newsgroup: comp.sys.atari.st
Date: 1999-07-28 00:00:00 UTC
From: Alex Holland <a1exh@hotmail.com>
Message-ID: <7nlmov$1k3$1@nnrp1.deja.com>
Source record: 75392
Cross-posted to: alt.emulators.amiga,comp.sys.atari.st

Hi, for almost I year now I have been running the Thalion Webshrine.
For those who didn't know of it

http://Thalion.amiga.tm

It's a website dedicated to the creators of some classic 16bit games,
including one of the best RPG's on the Amiga - Ambermoon!

"Why Is he writing?"

Well I have a problem, I have most of the games BUT in Atari ST
format!! And I have a lot of the Amiga games but they are either not
boxed, or are beta versions!

I am asking the Amiga community to sell/donate/lend me some of the
missing titles so I can complete the games database.

"What does he mean complete? I was there the other day and they were
all available for download!"

That is true there is an Amiga version of all the games in one form or
another, but a lot are NOT the original game but a crack (It was easier
at the time to disk image them, and the lack of copy protection makes
them easier to use with emulators!)

Now I have some time, and my A4000 is up and running I want to convert
all the ORIGINALS to WARP images!

The games I am most eager to get are

Ghost Battle
A Prehistoric Tale
The Seven Gates of Jambala
Leavin' Teramis

Even if you dont want to part with your game you could learn how to
disk image the original, and scan in the Documentation/box covers!

Any help appreciated

Cheers

Alex Holland

Hi,
I want to buy Cab 3.0 , the superfast version of the only neat
browser for Atari. It only has to be programmed by alexander Clauss
I cannot imagine i'm the only one who wants it, so come on guys,
let's give alex a signal that we want his update for atari and not
for that ugly Imac, a computer which is bound to drop of the store
shelves within a few months......
So let's visit his homepage and send him an email.
his homepage can be found on http://www.tu-darmstadt.de/~aclauss/
If we all react, he cannot ignore our wish and of course we want to
pay for it, cause good work has to be paid.
So react in this newsgroup and to Alexander in person.
Let's hope he'll do it !
Jos

2554. Interesting prob with MiNT/NAES/Thing/STiNG

Newsgroup: comp.sys.atari.st
Date: 1999-07-29 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <37a08c2c2d4be10@ping.be>
Source record: 75247

Hello world,

I normaly uses MiNTnet for my Internet connection but I do have a working
STiNG v1.2 too.

In order to test a few things I had to delete the proxy entries in STiNG's
'default.cfg'. So far no problem until I realised that I had also set the
proxies in 'mint.cnf' (setenv http_proxy http://proxy.ping.be:80/, etc.)
So I deleted these lines too but now I got this warning when the system
tried to load Thing 1.27:

pid 22 (thing) ILLEGAL INSTRUCTION: User PC=26B6D46

At first I really hadn't any clue why Thing refused to load.
I tried it with the Jinnee desktop too but everything was normal.
I was already blaming Thing for this until I noticed that my Thing setup
and Jinnee setup wasn't the same.
With Thing I was using 'Schon_Me' as screensaver whereas with Jinnee I was
using Twilight.

I rebooted my Hades but this time without the Schon_Me screensaver.
Bingo, everything worked without any problem.

I do know now what caused the problem but I really don't understand why a
thing like 'setenv http_proxy http://proxy.ping.be:80/' in 'mint.cnf' can
crash Thing.
For me this doesn't make any sence at all.

BTW: I can use Schon_Me with my freeMiNT 1.15.2b/N.AES 1.2.0/Thing 1.27/STiNG
setup if I start STiNG from mint.cnf.

Weird problem isn't it?

No pain at all her with Quadra 650 and Quadra 800; they both four scsi
devices connected to them with absolutely no problem ....
The only thing I had to be carefull was to put the scanner in first place
with the Quadra 650, but it was documented in the scanner owner's manual.

2557. new NOS out 0.47a3

Newsgroup: comp.sys.atari.st
Date: 1999-07-29 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <8783_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 75250

```
I updated the web page so you can do an http transfer at:

http://www.interware.it/users/mike/pub/

- nntp bug fixed, posting article worked only if nntp trace>=3

- added multiple serial ports support, specify BIOS number:
# if port 0 type dev buff MTU baud
# --- ---- - ---- --- ---- --- -----
# AUX:
#attach asy 1 0 ppp pp0 32767 1500 57600
# modem 2
attach asy 7 0 ppp pp1 32767 1500 38400
# serial 2
attach asy 9 0 ppp pp0 32767 1500 57600
# modem 1
attach asy 6 0 ppp pp2 32767 1500 19200
BIOS numbers for port are for a TT, for some reason to investigate
this does not work if you specify the modem1 port as the first device.
no dsr/drt up/down support for the moment.

- bugfix: domain cache list bombed ( ARGV1 instead of ARGV0 )

- added domain cache dump to reset cache

- bugfix: this was a very OLD bug, detaching of asy interfaces didn't
work as the asy pointer was not set to NULLIF in st_asy.c

- add http support, new commands:
cab directory <path>: to specify where CAB.APP can be found
cab head <url>: to get header informations on a url
cab get <url> <filename>: to get and url and save it to file !!!
cab start: !!!!!!!!!!!!!! yes this starts the browser ad then you can
navigate, cache is supported, POST is still NOT supported, sorry, no search
engines !

- change in ftp server, directory listing is now unix-like, so
that you can use graphic ftp clients
the change is made to the dir listing routing, so all commands using
the dir() function are affected, i.e. "dir", "ls", etc.

- bugfix: it was impossible to set the INLINE dialing on

- bugfix: telnet to a wrong port passed by name now works
the resolve routine to find the port number can be used
keeping in mind a wrong name makes it return -1, but
fsocket->sin_port is unsigned short
```

- new SEND command to send strings to any port:
send <host> <port> <strings>...
port can be specified by name as telnet

- log changed: no more debug log in smtp client and dialer
no log of memory allocation at startup
log of PPP/PAP session

- nntp client change:
headers received are put in the "get" file if session aborted
killed or exited, and articles are not get, so you do not loose
articles when NEWNEWS is not available (STAT, GROUP)

- changes in dialer display, please test

- CAB POST implemented, try it please on search engines and forms!

Hi Chris

What it's worth depends on what machine you have, TOS version, memory,
internal disk drive, software and hardware with it.

I want it to, but it has been almost a year, that we didn`t see anything
from Alexander Clauss in this ng. With all that expose he get in the mac world,
don`t expect anything from him anymore.

Can`t say I blame him, he has to make a living, and my guess is that 1% of the
mac marked is more than 40-50% of the Atari marked today.

But anyway, I do like to see a fast version of CAB, and with some of the
features from iCab. And yes, I pay for it, as I did from version 2.0 - 2.5 -
and up till now version 2.7.

cheers

Did Alexander have Cab 3.0 in the works?

I'll drop him a mail. I know I've enjoyed CAB 2.7 and I have found it
fairly complete. I'm just waiting for the Overlay to catch up so that
the cookies will work a little better, and for that java module to run
the lesser items on the internet.

Alexander if nothing else showed us that good HTML reading was possible
on the Atari. Then others turned it into a browser.

I believe in time other browsers will be hacked together, but I
wouldn't mind giving Alexander my money. It's fun saying I'm a
"CabDriver". :)

2568. Playing games from the Little Gren Desktop Webpage..

Newsgroup: comp.sys.atari.st
Date: 1999-07-29 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37A0A0F3.33C6@geocities.com>
Source record: 75261

I was recently visited the Little Green Desktop page and found much to my surprise... megs apon megs of GAMES! I had always thought that the 8-bit had one up on the ST due to the game play ability, but after what I've seen, I think I need to check out this wide array of games I've found... my view might change!

So, my question here is, how to play/run a game off the Little Green Desktop video game archieve? They appear to be hundreds of DISK IMAGES. You download a 700K (average) zipped file that once unzipped, turns into a 900K file. Once again, probably similiar to an ATR in the 8-bit world. (and probably designed to be run on emulators rather than true STs.. but I'm hoping that can be remedied. :)

One file I downloaded was from the AUTOMATION disk archieve. It starts out as a file called "A_069_4.zip" that is 575K in size. Once zipped, it becomes "A_069_4.ST" which is 820K in size.

The ST naturally wants to display this as a text file when trying to execute this. :)

So wants the word? How can a potenial ST gamer open this up on his trusty STE?

Thanks in advance,

Doctor Clu

It's probably either STiNG or the screensaver that crash. Both run during
interrupts, so they run in the context of the interrupted process. That's
why MiNT reports a crash in Thing.

I have over 80 titles for the Atari 520/1040ST series of computers and I am willing to get rid of them, but with NO documentation whatsoever with any of them (I lost or never had), but they are all LEGAL software titles.

If you want a listing, I created one in Microsoft Excel format on the Macintosh (version 5.0) and I can send that to you via e-mail if you so shall desire, I can also re-save another copy in text format and send that to you too.

The cost (US ONLY) is $20.00 for ALL titles to any US address, but must be pre-paid. I will accept checks or money orders, but if you send me a check I will wait 2 weeks for it to clear my bank. I will give you my snail mail address via e-mail if you are really interested. NOTE: The $20.00 includes the shipping.

Doctor Vell

>
>Bob-King.

Hi Bob

I, along with a few others have mentioned it, haven't we Nic;) It really
does help if the respondent knows where the poster lives and it doesn't
take much to add a USA etc. in the posting.

The email address can't be a guarantee that the person is from the
country designated. Neither can the currency e.g. $'s could be one of
several countries!

I reckon this should be part of netiquette. I don't believe it! I spent
it right first time;)

I never did find an Epson so I picked up a UMAX Astra 2400S. Thanks
to Nima I can use it!! Anyway don't listen to the mac guy. My
scanner is scsi-2 connected to the TT which is scsi-1 with a cable
that simply goes from on connecter to the other. Very straight
forward. Long as you place the scanner in the chain with a unique
scsi ID and termination of the chain is correct it will work fine.
I don't think will you have any problems like the mac user describes.

I agree with Lonny. My Quadra is a pain to setup with multiple drives.
The termination scheme on a lot of Apples are a pain.

> system (TOS & MagiC) both METADOS and METAXBS need to be in the auto
folder
> and depending which OS I require with the CDROM, one METAxxx manually
> disabled. Shouldn't grumble though :) Thanks.

Actually, for MagiC you can either rename \auto\metaxbs.prg to
\auto\metaxbs.prx or move it to the same folder as the XFS, because it
is loaded by the XFS anyway.

MagiC first loads the XFS and only then starts programs from the AUTO
folder. When it then tries to load metados.prg, it will not install
because metaxbs is already there.

So -- no problem :-)

Well, it depends on how you define Full Frame Rate Video.
The VideoMaster Falcon Cartridge will do 25/30 Frames per second
depending on if you are using a PAL or NTSC system.
I find 17FPS with VMF plenty fast enough with out using all the memory
that 25/30 FPS uses.
The Expose will do Color video at 128x80 25fps, 256x160 at 17fps and
512x320 at 6fps.

This is with a Stock 16Mhz Falcon. According to the Expose Manual if
the Bus speed is increased to 20Mhz The frame rate at Medium 256x160
will increase to 21fps. Now with a 50Mhz Bus one should get excellent
speed with 256x160 and 512x320.

As soon as I install my Expose on my CT2B Falcon, I'll find out just
how fast the FPS will increase. AFAIK the frame grab rate of the
Expose is only limited to the Bus speed.

Outdated ???
Are the Atari manuals for Pure C, Sozobon etc, current or something? I'd
say they're all out of date.

Current documentation (3rd party) is only available online now days.

Later,
Karl.

I got a 1040 STF (TOS 1.2) with a Megafile 30 at a car boot sale for NLG 5 (ï¿½1.50). And it works! It even has AT-speed fittted. But ... no mouse. However you can use a serial (PC)mouse. All you need is a driver. I got one that with AT-speed. I can mail it if anyone is interested, but you can problably find it on the net.

Greetings Robert

Not bad! I'll have to try it with CAB.

Speaking of which, how would you compare your Milan with other Atari computers you've had? I have a 1040ST and a 1040STE, both with 4 megs of ram one with a 16 mhz AdSpeed.
Though archiac, my current systems have led me to one conclusion... a faster Atari machine would be VERY worthwhile.

But I'm curious to hear how your Milan has stacked against your older machines, since I am thinking of getting an "Atari" Milan. :)

That's the beauty of the E-bay... you can put something up there for what you think it's worth, and if someone bids for it, you get the money. If not, you keep the item!

The fact that one person has bid for one of the items shows you have probably hit a good price range. At least what they were willing to pay.

And of course, there are always those that wait till the last minute to bid on items to keep from engauging in a price war with another bidder. (not that I personally know anyone that does that... hehehe....)

>from the Quick FAQ.

If you have the Falcon user disks for the machine, it will be on one of
those as well as some other applications. I don't think it is the
latest version, but will get your Control Panel working .
It's pretty hard to mess up a Falcon as far as software is concerned
and you don't have to be as cautious as with a Windows box. If the
machine has a hard disk, probably the most sensitive is a folder
called "auto" and anything in the root directory labled as "*.acc".
If you mess something up, hold down the control and alt key after you
see the hard disk driver run. It will be the first thing to happen
after you see the Fuji and memory test (which can be bypassed by
pressing the space bar) when powering up. This will allow you access
to the hard disk to change back whatever it was you were messing with.
First thing to do is format a floppy and find a program called
AHDI.PRG, likely in the AHDI folder or some other disk utilites
folder, and copy it to the floppy. If for some reason you hard disk
stops booting, use the floppy to gain access to the hard disk. Other
hard disk drivers to look for if AHDI is not found, ICDBOOT.PRG,
HDDRIVER.PRG,AHDI6XX.PRG. Watch as the machine boots and generally you
can see "starting HDdriver" or "Booting ICD" or just AHDI. That will
tell you which driver you have installed. That will be important
later.
That should keep you busy for a while.....

This is worst case, so just file it for later.

Mike

2596. Nominate your Atari

Hi All,

The British computer industry magazine "Computing" is running
a survey to find the most important innovations of the Millennium.

Assuming they mean ones related to computing I immediately
nominated the Atari ST for introducing a g.u.i (W.I.M.P.)
at home computing prices and for it's major contribution
to the success of MIDI, which was looking like another
failure until the ST arrived.

So if you feel like nominating your Atari then drop a mail
to computing_millennium@vnu.co.uk

Hi Doctor (medicine or science?)

Well let me start by saying that since i bought my Milan i've started my
1040 STE once for five minutes to transfer some files that were on extended
disks. Once your used to it there's no going back. And as for comparing,
well it's hard to do but the adverts said something like 20 times faster and
that's probably true but besides that there's colour (up to 32bit), bigger
ram, faster serial ports and lots of other things. All adds up to a feeling
of "Whooa" and when i started the STE everything felt kind of sluggish.
And Mint, what a difference when your used to singletasking. I mean my
homepage probably would have taken 10 times as long to do if i would have
to quit the program, load the file in CAB, see something wasn't right, quit
CAB, start the program, edit the page, save it... Well you get the picture.
I really would say, if you've got the money go for it. Or maybe wait for the
060 Milan but its computers, whenever you buy its always a better deal or
machine tommorow.

Just a couple of notes above you is a post on the programs and docs you
need for sale at auction on ebay. Once you have the docs you can examine
the minimum system requirements and see if your ST needs upgrading.
Early versions probably ran on a 1MB ST, some of the stuff offered on
the auction may require Falcon however.

jbodygt90@aol.com (JbodyGT90) wrote:

-> just as i said in the subject...i would like to find out about Atari's
and DOS
-> compatibility...thanx

I don't know much about the systems past the Atari 1040STe, but the orginal Atari ST computers with TOS 1.0 could read IBM PC disks but could not be read by an IBM PC, while 1.2 (or 1.02) could read/write the disks on both systems. I occassionally formatted a disk in 720K format on the PC to get more space than the Atari. But in order to run the programs, you would have needed a PC Emulator, like PC Ditto, but they usually ran super duper SLOW!

Source record: 75156

```
- nntp bug fixed, posting article worked only if nntp trace>=3

- added multiple serial ports support, specify BIOS number:
# if port 0 type dev buff MTU baud
# --- ---- - ---- --- ---- --- -----
# AUX:
#attach asy 1 0 ppp pp0 32767 1500 57600
# modem 2
attach asy 7 0 ppp pp1 32767 1500 38400
# serial 2
attach asy 9 0 ppp pp0 32767 1500 57600
# modem 1
attach asy 6 0 ppp pp2 32767 1500 19200
BIOS numbers for port are for a TT, for some reason to investigate
this does not work if you specify the modem1 port as the first device.
no dsr/drt up/down support for the moment.

- bugfix: domain cache list bombed ( ARGV1 instead of ARGV0 )

- added domain cache dump to reset cache

- bugfix: this was a very OLD bug, detaching of asy interfaces didn't
work as the asy pointer was not set to NULLIF in st_asy.c

- add http support, new commands:
cab directory <path>: to specify where CAB.APP can be found
cab head <url>: to get header informations on a url
cab get <url> <filename>: to get and url and save it to file !!!
cab start: !!!!!!!!!!!!!! yes this starts the browser ad then you can
navigate, cache is supported, POST is still NOT supported, sorry, no search
engines !

- change in ftp server, directory listing is now unix-like, so
that you can use graphic ftp clients
the change is made to the dir listing routing, so all commands using
the dir() function are affected, i.e. "dir", "ls", etc.

- bugfix: it was impossible to set the INLINE dialing on

- bugfix: telnet to a wrong port passed by name now works
the resolve routine to find the port number can be used
keeping in mind a wrong name makes it return -1, but
fsocket->sin_port is unsigned short

- new SEND command to send strings to any port:
send <host> <port> <strings>...
port can be specified by name as telnet
```

- log changed: no more debug log in smtp client and dialer
no log of memory allocation at startup
log of PPP/PAP session

- nntp client change:
headers received are put in the "get" file if session aborted
killed or exited, and articles are not get, so you do not loose
articles when NEWNEWS is not available (STAT, GROUP)

- changes in dialer display, please test

- CAB POST implemented, try it please on search engines and forms!

Just check this out: http://xonline.atari.org/wanted.htm !!!
CAB is the first in the list! (36 demands by now)
BTW in this list one must indicate if one is willing to pay for the
thing asked, maybe that could interested Alex.
Ask Jan Daldrup (mailto:thex@atari.org) for the stats.

> So let's visit his homepage and send him an email.
Seems he is going to be flamed to death!

> So react in this newsgroup and to Alexander in person.
And please also do on X-Online's Most Wanted!

> Let's hope he'll do it !
Just in case you should also ask him if he is ready to put the code in
the public domain if he does not care any more...

Cheers,
Guillaume

Have you tried to install more than two devices inside? From what I
understand, the mac uses a "special" cable to determine what is
connected inside. At least my 800 does. It took me a while to discover
that...I had to tread through the Apple support site:). External, no problem.
Mike

->
->So, erm....Help!
->
->Hugh
->
->.

Hi Hugh. Those are Desk Accessories that sit under the "desk" listing
in the Menu Bar, and the X-Control panel is one of them. They all
have a *.ACC extension and reside on your C:\ drives root partition.
X-Control, in turn- controls CPX's (Control Panel Extensions). Did
your Falcon come with a MultiTos floppy disk, or one called Language?
If so, you can find X-Control on them. If not, you can grab them from
just about any good ftp site that carries Atari software...

PS Hmm...tell us more about your Falcon! Does it have a hard
disk drive? Memory? Etc, etc,...it will help us to help you
better... ;-)

Catch ya later...

The taskbar is W95 term, I suppose you're talking about the desktop
menu. You are looking in the right place.

The control panel is an .acc program (Desk Accessory), therefore it
isn't in ROM. If you are booting from an emtpy floppy, you won't have
it. To run ACCs, you have to put them in the root directory of your boot
drive (A or C), and they will load on bootup. You can only have 6
accessories at one single time.

The latest control panel from Atari is Xcontrol.acc, and you can get it
from the Quick FAQ.

In the US you probably missed the popularity the ST had as a games
machine in Europe, especially France and the UK where most of the games
came from.

Having now got a very nice GT5000 for my Falcon, I definitely have no use for my flatbed A4 scanner/copier used with my ST.

Scans straight into Megapaint 4, Calamus 1.09N, printer port. Software includes driver, image editor, screen dump - works from within programs to give hard copy on heat copy paper. Up to 16 gray levels.

ï¿½50 +pp (heavy and solid) UK mainland only.

From: perler@yahoo.com
Message-ID: <8E13CC157sproklotzfotzel@News.CIS.DFN.DE>
Source record: 75287

Hi!

We have here in our recording studio an old atari ST (without even a harddisk) and got a steinberg timelock, which is a piece of hardware to synchronise the ST with our tape machine.

the problem is, we have absolutely no clue how to do this, documentation is not available and to get infos on the web is almost impossible.

we have this idea that we need cubase. but 1) will it run on this little atari? and 2) is there a demo-version outthere somewhere, because we need only the functionality of synchronising - nothing else, no sequencing, no saving, no nothing...

thanks in advance for all your help,

PAT

Previously...

For 3 years I was the only patent examiner using a computer for day to
day use and it was an Atari!!!!!! ..... (clip!)
When we were first PC'd, I went over to Protext 4.3 on the PC and First
Choice (for the data base) and this was purely for the better display.
Now we are all using Windows NT, WordPerfect, Netscape etc etc and its
soooooo dull!!!

Bob King

@>-->--------------

Precisely. I used a Macintosh for years because it was different and
better. It proved to me that alternative could exist.
When microsoft poured in millions of dollars to keep Apple afloat and
Apple killed the Newton...

I found Atari a nice alternative. :)

Now I do more and more on my Atari ST, and my Macintosh is becoming a
storage media for the ST (and even that is diminishing).

Now when I get that Milan perhaps I'll be a little closer to the
beautiful colors and graphics of my Mac.. that's about the only thing
I'm missing right now...

Not mine: two hard disks and a CD-ROM connected inside the 800.
The only thing I have problem is: I have tried to install the Apple PPC 601 pds upgrade card, but the computer refuses then to boot ...
Though putting it inside the Quadra 605 (almost the same as 800 model ...) no problem ...
But I don't want to disturb "atari only users" here ... let's continue by mail if you have some answer to this problem ...

Thank you Richard Davey for the URL!

Yeh, here in the states like I've said before, fot those that didn't run out and buy an ST when they first came out and then followed the ST/Atari circuit, the ST really seemed to flop.
This was even the view of the Atari 8-bit users. I saw pieces of Atari ST equipment in used computer stores, and I would remember how I in the past I heard that the Atari ST and Amiga came out in a rush. The way we had heard, Amiga came out from a stolen design from Atari, and Atari released the ST in a rush. The ST was a little undercooked and flopped, and Atari sued Amiga, and therefore also flopped.

PC took prominence and Macintosh slowly pulled forward with it's own identity to today where it has become a household name if not a preferrence with the iMac. :)

Truth is, when I found ST was still around in '98 and learned that the motorola processor was the focus of computer training in Europe for years only NOW starting to adopt the Intel... it seemed like a strange parallel universe to the computer world I had come to know.

I remember seeing Atari Computing #10 with the X-Files cover and thinking to myself "Wow... Atari users have a fun way of approaching the computer world".

So yeh, if I seem overwhelmed by a lot of this, or if I tell that story a few hundred times, forgive me... it's all so cool. It's not that there are hundreds of games for a computer that once was... it that there is hundreds of games for a computer still widely used and sworn by. ;)

Talk soon,

Doctor Clu
(Working more everyday to cram an Atari computer
into my life today and the future...) (grin)

Message-ID: <37a3555a1d7cb61@mail.otenet.gr>
Source record: 75170

Hi all

RSC_TRAN, the tool for easier RSC translations has been updated and
will now create a file containing the tree(s)/object(s) where some text
overflow might have occured. It stores the rest of the 'clipped' text
plus the whole text line. Now you know exactly where to search in the
RSC (since sometimes fields are hidden :-) Get it from my homepage.

2638. Help with sending MIDI files from MAC to Atari ST

Newsgroup: comp.sys.atari.st
Date: 1999-07-31 00:00:00 UTC
From: czit@gte.net
Message-ID: <czit-3107991251500001@1cust37.tnt3.san-fernando.ca.da.uu.net>
Source record: 75171
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Any ideas on how I could download a MIDI file on my MAC 2ci and then play
them on my Atari ST sequencer?

Is there any way to get the Atari to read a MAC floppy disk?

Or could I hook up a MIDI interface to the MAC and then ship the MIDI file
to the Atari throuh a MIDI cable?

I'm new at this, so I would grateful for any help.

And not only could you link with other STs, but with PCs and Amigas as
well. I used to play against a friend with an A500 quite often.

I don't have it anymore, but I would be surprised if you can't find it on
Little Green Desktop...

> I think we should take 1 picture (the same) and we time it.

Good idea. I have used my Falcon extensively for graphics and my observations have included JPEG viewing on a friends TT. If I load a JPEG into GEM-view 3 with DSP unpacking checked on I easily halve the amount of time needed to view the image. That isn't really the full picture because GEM-view's slow octree calculations and dithering to 256 colour account for 95% of the time involved in loading a JPEG. I think the increase in unpacking speed must be at least 10-12 time faster with DSP with GEM-view. Other software like MGIF can depack JPEG faster than GEM-view, but nothing beats the JPEGD decoder or APEX JPEG viewer for sheer speed...the TT seems to work more than twice as fast as a 16MHz Falcon but slightly faster than a 32MHz Falcon with MGIF, maybe the faster/wider RAM helps there...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Source record: 75183

I've installed an Eclipse and I've got some wierd problems...

Firstly Although we've now got it working hardware wise theres some sort of software glitch ....It doesn't come up with the right colours on the desktop, ...everything is the wrong colour....Apparently this is a problem that occurs if you have a 2Mb card and are using 4mb setting and vice versa, but I've got a 4Mb card and the setting is right....Dave at Titan (I took it up to him for the installation and we were both stumped) says it happened earlier in the development and he's forgotten what the fix was....it is a software issue though, the hardware is working fine and apart from the colour problem it is pretty good....it's a lot faster than normal....and then you realise it's doing it at 1024x768x16-bit.....

Secondly ....The colour mismatch is affecting my <normal> desktopp too....it is currently bright pink...I've looked at the colours CPX and it's a mess.....

Thirdly....how do I get a 1280x1024x24-bit mode out of the Eclipse...there doesn't seem to be an option for it ATM. It'll need to be 60 or 72 Hz refresh as that is all my monitor can do.....

Carl Zittrer wrote in message ...

>Is there any way to get the Atari to read a MAC floppy disk?

Possibly, but it might be easier to get the Mac to use disks the Atari can use. Newer Macs have the capacity built in to read/write DOS (PC) floppies which the Atari is quite happy to use. You can get the software for older Macs - IIRC it's called PC-Exchange.

>Or could I hook up a MIDI interface to the MAC and then ship the MIDI file
>to the Atari throuh a MIDI cable?

Doubtful. You could do it with a null modem serial cable and a comms package on each machine, I guess.

Message-ID: <memo.19990801191147.10573A@iwb.compulink.co.uk>
Source record: 75187

I'm looking for a good home for my Atari SLM804. The printer is complete
and includes the manual, plus the following:
spare SLM804 carcass for spares
spare drum unit (£130 value)
spare toner cartridge (£30 value - still available from SysSol)

All of the above is available FREE to a good cause (school, charity, etc.)
or £50 to the first person to e-mail me!

"Buyer" must collect - Surrey, UK.

Regards,

Ian B

Hello Carl,

CZ>Is there any way to get the Atari to read a MAC floppy disk?
yes, there is a program called MACSEE that is able to read and transfer files from mac media (floppy, hard drives and removable disks).

It was sold by CCD (Germany), a company of which I don't know if they still exist.

CZ>Or could I hook up a MIDI interface to the MAC and then ship the MIDI
CZ>file to the Atari throuh a MIDI cable?
I think a null modem cable (and two terminal programs) will do the job.

Regards, Peter

Hi!

Is there any easy solution to make it possible to read mails and to do simple browsing (maybe chatting) on an Atari 1040 STFM with 2 MB and NO HARDDISK? Something like a 1 or 2 disk solution?

My Atari days are over since 10 years so I am not very skilled anymore. I do not have any software exept those on my PC (pack programs i.e.).

My girlfriend would love to have some internet connection over the Atari!

Is it possible???

Thanks

TORN

These items gotta go!!! I need the space!!! They goes
as follows:

System Packages for sale:

System 1:
* Atari Mega ST
* Color Monitor
* 500 + Hard Drive w/CDRom & Tape backup Drives
(Comes with 20+ Tape Carts, 4 CD case caddies & 1 Atari CD with
lots of programs - <Gemini Atari CD-Rom, Dec. 1993>)
* Atari SM804 w/Outburst (Needs new drum and toner)
* Migraph Hand page scanner
* 14400 Fax Modem
* Programs left on the Hard Dive are: Data Manager, Degas Elete,
Mortcalc, Retcalc, GramSlam, PageStream, Touch UP, WordPerfect,
Animate, AVSPlay, Film Play, GemView Demo, Iff Src, JPEG, Player,
Games: Battle Chess, Battle Ship, Hackman2, Match, Missle Command,
Pinball, Spaceball, Tetris, Games end, STZip, ARC Shell, Esscode, LHARC,
IBM Emulator, Mac Emulator, CalShow6.2A, Geneva, STFax, Warp 9, Stalker,
DB3 Tape Backup Software, G+Plus, Connect, Virus Program and more!

System 2:
* Atari 1040 w/16 Megs and a switcher (8 to 16 Mhz)
* 130+ Hard Drive (In 2 cases connected by a cable)
* 14400 Fax Modem
* Color Monitor
* Migraph Hand Scanner
* Programs left on the Hard Drive are: Data Manager, Degas Elete, Mortcalc,
Retcalc, GramSlam, PageStream, Touch Up, WordPerfect, Word Write, STZip,
CalShow 6.2, Warp 9, STFax, Stalker, AB Calculator, Games: Loom, Match,
Missle Command, Pac Mania, Speech and more!

I have other software & Hardware that I'll post later... when I get them
together.

Excepting 1st reasonable offer! Buyer(s) pays shipping!!

2672. GTLOOK 2 is PD

Newsgroup: comp.sys.atari.st
Date: 1999-08-02 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <37A56D21.23739981@patent.gov.uk>
Source record: 75205

The Epson scanner software is now PD, version 2.11 according to:

http://www.atari-computer.com/xonline/maine.htm

look for look_211.zip.

That's the good news.

The bad news, at least for me with my GT5000, is

The connection possibilities have now grown, and the one I/we want....
external SCSI .. is grayed out. The 'return' button seems dead as well,
and my Falcon seizes up. I just can't get it to run

Can any one help, not with the translation but with getting it to work.

I have an earlier version of GTLOOK 2, looking at the code in KNIFEST,
it has the screen to produce user gradation curves, but I cannot get
these. It came on HD with the computer so I have no manual. Any help
please.

Bob-King.

2673. GDPS scanner drivers for Falcon.

Newsgroup: comp.sys.atari.st
Date: 1999-08-02 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <37A578A7.BCA1058E@patent.gov.uk>
Source record: 75206

I have GDPSINIT GDPS_SC.PRG and various GDPS.ACC for the Epson scanner, group, also SCAN_IT.PRG. None of these seem to work with the Falcon. They all insist that 'no scanner driver has been installed', (I think that's what the German says). I seem to remember that at least one of them got further than that on my MegaST4.

Although I have GTLook up and working, any help would be most appreciated, please.

Bob_King.

Let's go backwards. After 'Power without the price' there is now the
'Nothing is impossible on an ATARI!' :-)

With 2 MB and no harddisk your obvious choise is STinG. It's SingleTOS
compatible and can be installed on a 720 KB floppy. There is room for
some more programs. At this point you should decide if 0.5 or 1 MB of
your memory should become a RAM disk. I think this will speed some
operations a lot. On the second flopy you can install other Internet
software. For mail, news and simple browsing there is NewSie 0.9x that
should be fine for such a setup.

Instructions for installing STinG and CAB 1.5 on a harddiskless system
with 1 MB of RAM (!) are in a page created by Tony Cianfaglione but
(sorry) can't find the URL right now. Anyone ?

"http://www.ettnet.se/~dlanor/sting/html" for STinG

You'll definitely find very helpful the Quick FAQ at
"http://quickfaq.atari.org/"

There are also hundrends of sites and many ftp servers for info and
downloads. We're still quite alive ;-)

Hope this helps a little.

2678. Highrez colour graphics card for ST

Newsgroup: comp.sys.atari.st
Date: 1999-08-02 00:00:00 UTC
From: wophead@hotmail.com
Message-ID: <7o4fbm$d3s$1@news8.svr.pol.co.uk>
Source record: 75211

Hi everybody ,

Just been reading the review of the veloce+ in ACC10,and it sounds
exactly what I want for my ST setup.
However is there/was there any higrez colour
graphics cards for the ST.
With the Veloce+ and maybe such a card I'll be able to hang onto my ST
well into the next millenium for professional use.

see ya

John

2679. How to transfer files Mac -> Falcon via LAN?

Newsgroup: comp.sys.atari.st
Date: 1999-08-02 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <7o4irv$97ok$1@spnode25.nerdc.ufl.edu>
Source record: 75212

hello friends:

I wonder if anyone here has been able to transfer files from Mac Local Talk network to Falcon using the Lan port? Is this possible and if yes could anyone explain in detail how to do it please?

I need to transfer all my Atari files so I can make a cd backup of my Falcon files.

Thanks a lot, Raymond

A normal STFM single sided case will do, you can remove the STF badge
for the old case, if you have it.

Depending where you are in the world, dictates whether it would be worth
while or not. I'm based in the UK, so there's no problem for Europe and
the UK...

In uno strano messaggio del 26 Jul 99 H.Robbers@cable.A2000.nl (2:333/608.1) scrisse a All in area 'COMP.SYS.ATARI.ST':
HR> 1: This version is a better one than V5.4 :-)

I checked some versions time ago, I am still looking for a debugger in my environment.

The current problem is I need to develop under MagiC, and nothing works on it! I may switch to MagiCMac or MagiCPC if not on my TT with a CrazyDots2 graphic card.

Is the current version supporting MagiC ? Will it ever do ?

I forgot to say my main compiler is Lattice C / Devpac, sometimes Pure C.

The STe language disk contains only the following:
BASIC interpreter
CONTROL.ACC
EMULATOR.ACC
EXAMPLE.PRG
and is, therefore, not really worth having! However, I'll ZIP it up, if
you're interested, and send it to you!

Regards,

Ian B

TT-Digger is NOT a debugger. It is a diagnostic tool, not related to a particular compiling system.

> it! I may switch to MagiCMac or MagiCPC if not on my TT with a CrazyDots2
> graphic card.
>
> Is the current version supporting MagiC ? Will it ever do ?

It runs on any TOS 1.0 compatable operating system, with any number of colors. :-)
I have myself a TT with MagiC 6 and a NOVA graphic card.

> I forgot to say my main compiler is Lattice C / Devpac, sometimes Pure C.

TTD recognizes executables, + the DRI and Pure C object format, NOT yet the formats produced by Lattice or Devpac. But I think you can have Lattice and Devpac produce the DRI format.

Since I've upgraded my UsR Sportster Flash modem to 56K (they installed me the 56K Voice ROMs, B567...), Straight-Fax doesn't work any longer. It seems to initialize the modem (Fax led flashing) but this is likely to return something wrong or unexpected 'cause Straight-Fax invariably shows the warning "The Modem is not responding. Please check etc...". Shall I change something in the UsR setup? Or configure it just as the old 33600 version (if so which are the settings to be changed?)? You Atarians, drop me some help line please!

2699. not so magiC

Newsgroup: comp.sys.atari.st
Date: 1999-08-02 00:00:00 UTC
From: Hugh Lutley <spewy@catvomit.u-net.com>
Message-ID: <37A617D2.164982D7@catvomit.u-net.com>
Source record: 75232

I'm just setting up my new Falcon but I have encountered a major problem. I prefer to use MagiC 5.11 as an operating system but after I partition my Quantum xp 4.2 gig drive to about 7 'divided' partitions with HD Driver 6, MagiC will hang up trying to access any other partition than C.

I have re-installed and no matter how minimal the installation (nothing but HD drive then MagiC) I'm still getting the same problem.

Anybody got a clue on this one?

Hugh

I seem to remember something similar untill I upgraded my HD Driver,have
you tried the demo of a later version,tried a previous or even AHDI at
least this would isolate the problem

>> >
>> >I'm sure the header said Free!!!!

:-)
Those were my first thoughts too when I read the message.. but maybe he
meant "free" as in he has some extra ones, that are "free" to sell.. I
dunno?
Ie, when you have.. hmm... for example if you had 2 fridges, and your
friend needs one, so one might say " I have a free fridge I can sell you."
Then again, maybe he just wanted to get our attention by lying :-)

Honestly, it is ingenious how the ST works. Though a completely
different machine all together... it looks like a Macintosh and works
like a PC, and is neither. :)

But the fact that an Atari will read a PC formatted disk is awesome.
Makes for easy transfer of files between other platforms and the ST (PC
and a Macintosh that writes PC disks). Great for transferring text
files and code.

Anyway, that's my view.

Hi,

I have 2 versions of the STE Language Disk.
One is version B and the other is version C.

There were 2 different versions of Tos that came with the STE.
TOS 1.62 is the last stock STE TOS afaik. It fixed a few bugs
that were in the previous version.

On the STE Language disk is a STE_FIX.PRG in the AUTO folder
that fixed a bug in the STE TOS. So it is useful
to have the language disk if you need that program.

Source record: 75056

> I haven't been able to find a listing of Telnet sites in my searches,

Telnet works a bit alike a terminal program, but uses URLs instead
of phone numbers. There are therefore no "sites" per se, as it is
mostly used to remote-control Unix systems.

Some ISPs also provide Telnet access for reading your e-mail by remote
using text-based mail-readers (as opposed to GUI-based e.g. GEM) but
this is becoming a rarity, as allowing Telnet connections opens all
sorts of security breaches.

I like the look of MagiC so this is annoying. What's wrong with me! I've been using PC's since the advent of the Pentium 90. I've got a 233mmx, a 400 celeron and the P90 running Linux. But I've just gone and bought a Falcon.....

I've got the strangest urge to go and buy a Imac now and get MagiCMac up and running..

Well i haven't tried that many games but all GEM-games work but every game
that makes calls to specific hardware addresses wont work. As for old serious
software most can be tweaked to work. For example at NAS there was this guy
who had some old programs from -86, some database and something else, and we
just loaded them and started and they could be used there was just something
that went wrong with the palette. If any one has anything particular they
would like to know if it works, just let me know and i'll try it. Starting to
sound like a sales rep but i'm just very pleased with the Milan.

Kommentar zu A7671@LU
Hello JbodyGT90,

j> just as i said in the subject...i would like to find out about Atari's and
j> DOS compatibility...thanx
First of all: Atari mainly produced computers with CPUs of Motorolas 68k family (as they were in the classic Macs), but also produced full DOS compatible PCs and palmtops with Intel CPUs (or compatible ones) which are totally different (-> http://www.atari-history.com).

About the 68k line: You can't just insert a DOS disk in an Atari floppy drive
and run DOS software. But under some aspects even the 68k Ataris are DOS compatible or can be made DOS compatible:

1. On source level, GEMDOS, the "DOS part" of TOS, is somehow DOS compatible.
The system calls have indeed the same function numbers.

GEM, the Mac-look-a-like GUI, came from the DOS world (also exists as X-GEM
under UNIX environment). TOS is built upon GEM 1 (GEM 2 exists as a separate
OS for the STs too), whereas most PC GEM programs are running with GEM 3.

Anyway, it is not that complicate to write programs running on both Atari and
PC GEM (but Atari GEM was *much* and not PC compatible enhanced since TOS 2).

2. To run DOS software on binary level (even Windows 3.11) you can place a little daughterboard with an 286 CPU upon the 680X0 CPU - a german product called "AT-Speed". For external use (and IMHO not that good) you can plug a
similar device to the ST's external ACSI (a stripped down Atari version of SCSI) hard disk port - this is named "Vortex AT-once".

In addition there are the software based (and therefore very slow) DOS emulators "PC-Ditto", "MS-DOZ" and "SoftPC" (never sold, alpha stage).

3. At least, the floppy disk/hard disk structure is very similar (not to say
nearly identical) but lacks a bit due to erros in MS-DOS (MS didn't follow

there own rules at the floppy disk structure), limitations in most PC BIOS (TOS is more flexible) and slightly but imminent different organisation on partitions bigger than 32 MB (but for all of this there is TOS software to handle it).

Greetings, Oliver

No, they're NOT developing, but they are kinda supporting.. new packages are
available.

Hi Derryck!

I assume you're looking for a site listing BBS systems that can be used
over Telnet. If so I know just the site!

It's called The BBS Corner, and the URL is:

http://www.thedirectory.org/telnet/

Cheers!

>have the font support that NVDI has?

fVDI doesn't replace the font handling bit of NVDI, I'm planning on having either NVDI or SPeedoGDOS (4 and 5 respectively) handling fonts and printers. Basically I've messed up the software install and am seeing if anyone can help before the fVDI devlopers get back from hols or whatever (if they are on holiday that is) The Hardware runs fine and barring this re-arrangement of desktop colours everything is hunky-dory, ...it's screaming fast as well....just odd colours.....I've got a highly bosdged and modified system too so that could be the source of the problem....

It's also used for things like MUDs and MOOs (sorry, no URLs), IRC if you haven't got an IRC program (you can telnet to some servers I believe), and (*puts on work hat*) it's quite common to find library catalogues available via telnet, though many are moving to web-based interfaces for remote access now. If you *really* want to see what we've got in the library at MMU, you can try telnetting to:

telnet://mpclient2.talis.mmu.ac.uk:1023

The last bit is the port number (standard is 23, so you'll need to enter it). BTW the only Atari client which works properly with it is TVT102 (I used it to help beta test that program).

2751. WTB: Burned ROM Cartridge of ST Star Raiders

Newsgroup: comp.sys.atari.st
Date: 1999-08-04 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37A7D001.F70@geocities.com>
Source record: 75084

Hello Atari hard ware hackers out there,

I have a Star Raiders collection going. What can I say? Star Raiders was my favorite game on the Atari 8-bit, and so, weither it sucked or not, I also went about getting the 2600, 5200, 8-bit, & ST versions of Star Raiders, and Star Raiders II.

(I'm curious if AtariSoft developed Star Raiders for any other platforms now... hmmm...)

But one thing I am curious of is the possibly of making a Star Raiders cartridge for the ST.

ST ROM cartridges are traditionally 128K.

ST Star Raiders is 223056 bytes. :(

However, we have ST computers (8mhz) surfing the internet with floppy drives hacked to 1.44 floppies and running with hacked ports to 57 K baud.

So in the ST world, hardware limitations are not always absolute.

So I'm curious... has a way of backswitching or some other way be made to break the 128K barrier?

If so, I would love to talk to someone about making this cartridge to complete my collection of Star Raiders cartridges.

Thanks in advance!

Yep. Nice to see programs where support has ceased being released into the PD, rather than being zapped from the developers' drives.

>The connection possibilities have now grown, and the one I/we want....
>external SCSI .. is grayed out. The 'return' button seems dead as well,
>and my Falcon seizes up. I just can't get it to run

Hmm. A quick GEMTrade of the readme seems to suggest that you can use either the builtin SCSI routine or an external SCSI driver. I suggest that you get hold of Steffen Engel's SCSIDRV.PRG (I found it in the GEMAR distribution), and run this before you run the scanner software. You can do this from the desktop, it should report all the drives (and hopefully the scanner too).

>Can any one help, not with the translation but with getting it to work.
A silly question, but did you have the scanner switched on before you booted the Falcon? I think this is a necessity.

>these. It came on HD with the computer so I have no manual. Any help
>please.
The above is a suggestion based on my experiences with Nima's scanner driver, hope it helps.

Checked out the FAQ and they mention a location to pick up the
uncompression program for the archieve files ending with ".ST" as being:

http://st2disk.atari.org/

However, I have gotton no response from atari.org tonight.

Would anyone know of another location to pick up this utility?

Thanks!

Source record: 75091

It's the 'old' version 1.0 something that came with the computer and
that I've got working. It has references to defining user gradation
curves in the coding, but not active in the programme. It's the latest
(just released) 2.11 version that has the grayed out parts and the dead
return button. All GTLOOK 2's are self contained and need no initialiser
or SCSI driver. I have tried the SCSI driver you mention in your other
posting. It identifies the scanner (yes I switch it on before
everything) as device 4, and keaves it at that.

I must re-assemble my MegaST and HD to try out the various GDPS drivers.
I assume that the GDPS drivers that came with Photoline wirk on the
Falcon, but there is not one for the Epson. Never mind, at least GTLOOK
2 v 1.?? works.

regards

Bob King.

OK, now I know this is all in jest, but.... don't you think it's a bit
much to criticize a guy who is trying to help the Atari community by
offering his surplus ST keyboards for only $10 - including shipping to
anywhere in the US? After you subtract the shipping cost, it's really
hardly worth the hassle of packing it up with all the proper padding,
and taking it to the post office, waiting in line to find out how much
it costs to ship, etc. I suspect he meant something more like this:
keyboard = free, shipping and handling = $10. That IS a decent price,
you know. Randy is (or was?) looking into possibly carrying on
developement for the Hybrid Arts EditTrack sequencer. I haven't heard
from him in awhile - I hope he hasn't given up on the project.

Now, be nice! ;-)

Clayton,

As a professional verbal nit picker and corrector of legal ambiguities,
I couldn't agree more with you. The message clearly said that the
"$10.00 each includes postage anywhere in the US".
Is the guy to be pilloried for not saying "The keyboards themselves are
free, but, so as not to incur a loss, I must charge you $10.00 to cover
package and postage".
Lets just hope he gets some positive response. Otherwise, the next time
he has anything for disposal, he could well say 'sod the lot of them,
into the skip'!

Bob-King.

2761. Timeworks "Data Manager" and year 2000 - possible?

Newsgroup: comp.sys.atari.st
Date: 1999-08-04 00:00:00 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <7o9rbr$85k@freenet-news.carleton.ca>
Source record: 75094

I have been using Timeworks "Data Manager" ever since it came out. It was only recently that I tried to enter a year "2000" date and realized that there was going to be a *major* problem.

Date data is entered in an MM/DD/YY format, i.e., only the last two digits of the year. "Data Manager" interprets MM/DD/00 as a date in the year of 1900.

Any ideas? Or are there any other comparable Data bases in the Atari world?

All suggestions welcome.

Randy Kwak

>settings if you like but why don't you use Gemulator 98 with a TOS
>image ? (at least until I find the manual ;-)

Thanks Man! BUT I FOUND IT!

After some digging in the storage shed looking for my HP 4 Plus manual, I found the damn Gemulator manual (16 page pamphlet really.)

In case anyone else needs it, I'll type it out here.

Excerpted from Page 13 & 14 of the Gemulator 3.0 Manual:

==========
The DIP switches are numbered 1 2 3 4 5 6 7 8. When they are up, they are considered to have a value of 0. When they are down, they have a value of 1. Take all the 1 switches and add them up using the following table to get the actual prot address:

DIP SWITCH SETTINGS:
switch 8 $200
switch 7 $100
switch 6 $080
switch 5 $040
switch 4 $020
switch 3 $010
switch 2 $008
switch 1 $004

Since the default address $240, which equals $200 + $040, that means that switches 5 and 8 are in the down position and all the others are up. So if you are installing a board at address $224, you would need to have switches 1, 5, and 8 in the down position.
==========
Short and Sweet.

I also sent an email to Gemulator folks and they never replied.
Must be at a show or something.

(Well, back to cadding on the ST... (I think Cyber Cad is what my buddy uses... I gave him the Gemulator for his new computer after and he watched scenes render in seconds rather than hours on his STe! He shelled out for his

own PC right then so he could play PC games and run ST Software faster!)

KM>
KM> this may or may not help, BUT
KM> try running without HSModem enabled.I seem to recall that thatworked
KM> for me, probably a faulty HSModem installation.

No, it's not HSModem - I've been having the same problems with a new
USR 56k modem and Straight Fax. Straight Fax just will not see the
modem at all, whether HSModem is enabled or not. Toad (who sold
Straight Fax) issued a program that would test modems for
compatibility; when I run it, I get nothing but errors and no
response.

My solution is to keep my old GVC 14.4k modem sitting underneath the
USR, which still works fine with Straight Fax. A majour hassle, but I
can't really see any other solution.

I have tested the y2K question using Dbman 5 (both 5.2 and 5.3) and it
seems to work fine. With DBman you need to set the century seting to on.

i.e SET CENTURY ON

I use Dbman because its fully relational and the files are compatible with
the Dbase standard so can be imported and exported into programs on
"other" platforms.

AFAIK, Chris is the only customer who's got one so far. They are on
their way, though.

> Can you describe how fVDI fits into your system? I'm thinking of getting

Why don't you give it a try yourself?
fVDI has been available in various versions for a very long time and
the general behaviour is similar with the normal bitplane drivers.

I uploaded a new v0.94beta archive only a few hours ago. Among other
things this fixes some serious problems the bitplane drivers in the
previous beta had (I'd made some changes to the calling conventions and
forgot to update those drivers appropriately), but which noone told me
about until today...
(Since I have an Eclipse/RageII, I obviously don't run in the normal
graphics modes very often nowadays.)

> an Eclipse, but I would be put off if fVDI has to /replace/ NVDI. Does fVDI

Of course it doesn't (unless you want it to).

> have the font support that NVDI has?

fVDI should be able to deal with all bitmap fonts, but there's currently
no vector font support whatsoever. Just as with the NOVA VDI, you can
run NVDI 'on top', though, in which case it will be the main VDI and
use fVDI as a kind of device driver.
If you only want access to the NVDI printer drivers, you can also run
NVDI 'below' fVDI, in which case the screen output speed will be
unimpared (fVDI can be significantly faster at drawing text than NVDI,
especially on the Eclipse/RageII).

This 'dual VDI' operation has been tested with NVDI and FontGDOS and is
expected to work with other GDOSes too. Running another VDI 'below'
fVDI _can_ cause problems (the other VDI has no idea that this kind of
thing can be done), but the other way around should be quite safe.

Hi J�rgen,

After all the recent Milan bashing on this group it was good to read some positive remarks. I have had my Milan since Christmas and I too am very pleased and impressed. I haven't found many serious applications that don't work under Mint. The biggest problem area is the sound system, I haven't had much success even with the demos that were shipped with the Milan!

The other problem was that all the original software was in German and it took some time to get hold of English resource files.

If anyone is thinking of switching to a Mac or PC then they should really consider a Milan. Trying to stay up-to-date with all the developments on two platforms just sounds like hard work to me.

Peter.

Hi Peter

```
Do you have a Milanblaster and do you mean the demos that came with that.
Because without it the sound is, hmm how shall we put it, crap. It's supposed
to be some software emulation of the Yamaha chip i think but it doesn't do much.
As for resources maybe we could exchange with each other.

2775. CENTurbo 2 Info wanted

Newsgroup: comp.sys.atari.st
Date: 1999-08-05 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7oci6i$ah73@news.ajou.ac.kr>
Source record: 74995

I am starting to collect information on the CENTurbo 2.

I would like for other CT2 owners to e-mail me information
on what software they have found that works or doesn't work
with the CT2 in TURBO Mode.

Also, information on working AUTO Folder configurations.
Since some programs need to run in a certain order in the
AUTO folder, information such as this is also important and
needed.

Any information, tips or tricks pretaining to the CT2 is needed.
Along with any hardware that works or doesn't work with the CT2
in Turbo Modes.

If enough CT2 owners contribute information, then I will put it
all together and make it available to all CT2 owners and any other
Atari users that request it.

If you e-mail me information, please include info about your current
system, like the OS you run, Memory, external hardware, version of
the Flash you are using, Type of Hard Disk driver you are using,
CT2 board version you have A or B, Resolution you are running and etc.

I think this will help all CT2 owners get the most out of there system
and I hope that all CT2 owners will e-mail information.

You can e-mail me any info on the CT2 to me at:
phantomm@kih.net

Hi Chaps and chapesses

After trying to get my CD ROM to work with "Spin" with varying degrees of success,(Magic nor GEM would allow a desktop icon for the drive but I could access it through "Freedom"???), eventually I ran out of patience and brought ExtenDos Gold (which is excellent). My problem now is that I can't get rid of "Spin". I deleted every file that even had a passing acquaintance with program but still at Boot up I get "Spin" related errors and a dozen or so bombs!

Anybody any Ideas?
TIA for any help

My understanding is that there is a physical difference between DS/HD diskettes and DS/DD diskettes. The HD disks are thinner, thus there is a greater chance that writing to side A will erase side B and vice versa. I could format some HD disks, but not others. I was using TOS 1.62 and 1.4. It didn't seem to matter though, since I had problems with both computers.

dbMan is an old dBase III clone. Commercial, but old, so you'll have to
find someone willing to part with one, or check with a dealer.

Hi Steve,

S>How can I possibly troubleshoot which component is not working, or find
S>a place who can do it for me?
first, if you've got the whole ICD disk you will find thereon a
program called IDCHECK (or similar). That will give you an idea on
which ID your drive was found (or not, of course).

Then you should install the driver. by HDUTIL.PRG

One hint: If your drive is not bootable for the moment, you should try
to switch on the computer the drive being switched *off*! Then having
arrived on the desktop, switch on the drive and wait for reaching its
speed.

Then you should launch the driver from a floppy, and after all try to
install an icon for logical drive C:

..and Clayton Murray responds to John Kolak's response to Clayton Murray's comment about Randy, etc....:

Hi John,

You are right, Hybrid Arts was taken over by Barefoot, but then it was taken over by Binary Software. The owner (Robert Semaan) in Texas is just sitting on the rights, doing nothing towards developement. Randy has tried contacting him to persue developement, but he doesn't seem interested. :(That's too bad - if the guy isn't going to do anything with it, he should at least have enough courtesy (commen sense?) to step aside and let someone else go ahead with it!! I managed to buy EditTrack Platinum fron Robert right before he decided to not be in business any more. It took me a LONG time to get my software and manual from him, but he did eventually come thru with it. I had to get Platinum, because Gold won't run on the Falcon. I still have his phone and address (if it's still current) if you'd like to try contacting him.

Best regards,

> I need to transfer all my Atari files so I can make a cd backup of my Falcon files.
>
> Thanks a lot, Raymond

This is certainly possible (at least I've managed this successfully!). Here is the
hows and wherefors etc...

I use Connect 2.46 on the Falcon and Z_Term on the PowerMac. Just a standard LAN
cable does the trick. You will need to use HS-modem v7 on the Falcon to smooth a
few bugs and allow access to the higher port rates. Make sure both Mac and Falcon
are set to the same port speed, error checking (CRC16 or CRC32), handshake (RTS/CTS
is recommended) etc... Make sure you select the correct port on the Mac, and
LAN on
the Falcon. If you haven't used these software before have a good play because it
took me ages to setup both softwares before things worked well...

Baud rates may vary depending on the direction of dataflow. From Falcon -> Mac
I can
use 230400 baud (flat out!), yet from Mac -> Falcon I need to drop to 57600 or 115200
to xfer without (too many) errors. A few errors is OK cos the CRC checksum
means no
bad data will get through. One last thing is that I've found MagiC gives me
more stable
(less errors, faster) transfer than does the same setup under TOS 4.04 or MiNT.

let me know how it gets on...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Well, if it is the hard drive, try turning it upside down, however that
is done on your system. If it works that way, back it up promptly. If
it did not work that way, the problem is electronic. Has worked for me.

Source record: 75113

There have been some posted comments about Atari ST monitors, not exactly flattering.

Some of the tiny details are missing, but Atari did not design the first monochrome or the first color monitor they used. They used monitors used by NCR on bank machines.

This has two effects. One is that an NCR base fits an Atari monitor. But, in the US, the local office quality person called his opposite number at the factory, and that fellow did not think his job description included finding the part number for me. If anyone knows that part number, please post.

The other is that the tubes used can be re-gunned by a tv tube repair shop using guns left over from servicing NCR bank machine monitors.

They were not consumer toys, although they could be used to play games. They started out life as professional tools.

Chris your method works great! I am connected to the Net and using my Falcon's
Lan port connected to the Mac transfering files with no problem from Falcon <-> Mac. I can
even use the Mac and Falcon while transfering files!
I was not sure this was going to work this well. I am glad the Falcon has a LAN port :)
(which I never used before)

Thanks again for your help

Raymond

<ken

Hi Ken,

thank you for your suggestions, but my troubles don't depend on any
software setup or, better, no setup has changed on my Falcon, Straight-Fax
etc. They simply upgraded my modem to 56K and Straight-Fax simply refuses
to work... No HSModem problem, as before the upgrade I sent faxes properly
with or without that serial accelerator. I told you my modem can't be
initialized, so I would like to ask all Atarians about this: isn't there
any of you who usually sends faxes with Straight-Fax and a UsR 56K Voice
modem? If so, which Straight-Fax Modem Preferences did you set up? Which
UsR controls (S-registers included)? Thank you in advance.

2801. KVM.. possible Java port?

Newsgroup: comp.sys.atari.st
Date: 1999-08-05 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37A94200.6E20@geocities.com>
Source record: 75121

Fellow Atarians,

Well, I was hanging about in my OTHER orphaned platform newsgroup, the Newton MessagePad, and found an interesting article about a new java port that was done to the Palm Pilot in C.
Being that's the case, I thought I'd share this with the rest of the ST world and those trying to port over java to the ST.

Doctor Clu

@>-->----------

Subject: KVM: Possibly Java for the Newton
Date: 17 Jun 1999 20:04:33 GMT
From: Sean Luke <seanl@scruffy.cs.umd.edu>
Organization:U of Maryland, College Park, MD 20742
Newsgroups: comp.sys.newton.misc, comp.sys.newton.programmer

See http://java.sun.com/products/kvm/wp/

Further, at the Java One conference today, Sun committed to porting the KVM and its Java2 Micro Edition code to the Palm Pilot. This is a very controversial move on Sun's part, as it seems to be leaving some of the Sun licensees in the dust.

According to the white paper, the KVM is written entirely in clean C with relatively few system calls (and *possibly* no threading requirements), which would likely make porting to the Newton feasible. It needs "128K of available memory", though later the page says it's designed to work in "tens of K of heap". The engine and Micro Edition library has no AWT, in fact, no graphics calls of any kind. It's very stripped down, relying on the native GUI of the device (quite a departure from Sun's run-everywhere philosophy previously). This is accomplished through native function calls, which should make setting up an API to call NewtonScript calls pretty simple.

The big question is if/when Sun is going to release the code. If they never release it as open source, this may be just a pleasant excercise.

Sean, who really doesn't have time for this kind of thing, but thinks it's easily within the realm of doability...

There is an Atari port of an early version of Kaffe, the GNU
Java Virtual Machine. It doesn't support any graphics, but it's
a start. :-)

In article <37a88cf4290ed72@ping.be>,
tos4ever@ping.be (Martin "Nightowl" Byttebier) writes:
> Maybe you mean 'tos2gem'?

No, I'm quite sure he didn't mean TOS2GEM.

> This autodir prog lets you run TTP's into a window.

When using applications that support it, e.g. Thing or current versions
of Okami. It's not enough on its own to run TOS/TTP-programs in a
window.

It's more likely he ment something like TosWin/MiniWin (MiNT/MultiTOS)
or VT52 (MagiC), where only the first two allow an application-specific
menu bar, IIRC.

Ciao

What is Dbman ? I've ported CodeBase 4.x from PC/Unix etc (also fully
relational and Dbase III plus and Clipper compatible), and use this
library for database work on my ATARIs but I'd like to see Dbman.
Is it commercial, shareware or what ?

Thanks

Derryck,

A humble correction to my earlier reply. Your suggestion re. use of SCSIDRV.PRG worked. I'm still not sure why it didn't before. The 'external SCSI' box is now available and all is well .... there is still the very minor problem of the red 'incorrect command received from computer' light coming on on the scanner .. a reset cures that. I have extracted all the internal german text, GEMTraded it and will post an english lang. version if any one is interested. The coding does include english as well as french 'resource' text, so perhaps the install program with the commercial version had an option to enable the required language?. There is also a grayed out drop-down menu item to print .. the code refers to a prog. DA's Print? Any one heard of it?

Same here, since I first bought it in 1981, Star Raiders will always
be my personal favorite, but Sundog (and Amiga Pirates!) ranks right
up there with it for sheer enjoyment. If you haven't played Sundog,
you really should check it out. It's a different type of game than
SR, but just as interesting and addictive. There is a plot and a goal
you need to accomplish, but you're completely on your own as to how
you go about completing the game. Lots of things to do and see.

Check this site out, it's a great resource for Sundog:

http://www.lukin.com/sundog/index2.html

There's a couple of emulators that run Sundog, I've found WinSTon runs
it almost perfectly, it allows saving games but only the current one,
the library feature doesn't work. Otherwise, it's great.

Not that I know of, Star Raiders was an exclusive Atari game. There
have been many clones, but nothing like the original. The best SR
clone I've seen was Interactive Magic's Star Rangers. The CEO, Bill
Stealy mentioned that Star Raiders was one of his favorite games, so
Star Rangers was his salute to it. It was pretty faithful to the
original, but had several enhancements. It wasn't a bad game, but it
died in the PC market trying to go against the X-Wing and Wing
Commander series.

2818. Where can I

Newsgroup: comp.sys.atari.st
Date: 1999-08-05 00:00:00 UTC
From: wedd8454@my-deja.com
Message-ID: <7ocihh$l3m$1@nnrp1.deja.com>
Source record: 75138

I'm trying to get my STE to print to an HP1100 Laserprinter.
I've heard that another NVDI user got his going by using a printing
(switch) box; apparently the output level of the STE isn't high enough
to drive the HP1100.
Does anyone know where can I buy such a box? I need
to have this working urgently for a job, so a local (UK) supplier would
be best.
Many thanks for all help.

2819. How to use an Atari formated with Magic Mac?

Newsgroup: comp.sys.atari.st
Date: 1999-08-05 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <7ochbt$49h6$1@spnode25.nerdc.ufl.edu>
Source record: 75139

hellop friends:

No matter what I do I have not been able to get my Mac to read my scsi atari formated drive. I formated the drive on the Mac and it works no problem but I need to be able to copy all my internal ide partitions to the scsi drive and then connect it to the Mac. I have been told that it is supposed to work.
Has anyone details on exactly what to do to get it to work?

I formated the drive with HDriver and tried both single and multiples partitions.
Also I made sure I selected the scsi number on the Magic Mac setup.
The problem I have is that when the drive is atari formated the mac does not mount the scsi drive :(

If anyone is doing this, would you please describle your setup for me?

Thanks a lot.

Raymond

Ah, my buddy's ST 3.5" interna floppy drive has crapped out. Where might I find a replacement? It's not 1.44 and I think you need a chip mod to use one of the current 3.5" 1.44 units.

So, just a basic internal 720k floppy drive please!

You can send him the info at
smallroach@(remove this part for spam control)webtv.net
or post here

Thanks in advance.

Need some info on the MegaSTE.

1. Is there any upgrades that will allow more than 4 megs in
a MegaSTE?

2. Is TOS 2.06 the highest version one can use in the MSTE?

3. Does one have to set any DIP switches or software settings to
allow a DS external disk drive to work on a MSTE if you have a stock
internal HIGH Density disk drive?

4. Can one use newer type SCSI hard drives with the MegaSTE's internal
SCSI board? What about CDROM and CDR SCSI devices, can these also be
used with the internal SCSI board of the MSTE?

5. Is there only one Chip that controls the internal and external
floppy drives on the MSTE? What is the name of this chip or chips and
where is it located?

Any help with these questions is much appreciated,
phantomm@kih.net

2824. Disk Drives and Disks

Newsgroup: comp.sys.atari.st
Date: 1999-08-05 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7oci65$ah72@news.ajou.ac.kr>
Source record: 75144

I was messing around with a MEGA ST4 that has the RainBow TOS
v.1.4 the other day and noticed something strange with the
internal disk drive.
This Mega ST4 is in like new condition, I don't think it has ever
been used. There is no trace of dust on the motherboard or Fan.

Anyway, I went to format a DS disk and got a error that the disk
was damaged. I then tried to read a DS disk that I had formatted on
a 1040 STE TOS 1.62 4megs. And the Mega ST4 would not read it.

I then noticed that the disk I had tried to format and read were
High Density Disks.

I then tried to format a normal DD disk and had no problems at
all formatting. I formatted about 7 disks in a row with no trouble.

Also I tried to read normal Commercial program disks with no problems
and also DS DD disks that I had made on the STE TOS 1.62 and had no
problems.

But if I tried to read or format any High Density Disks then I would
get error messages.

This is the first time I have really used a TOS version below 1.62.
Now with the STE TOS 1.62 I can format High Density Disks into
DS/DD disks. My STE just has a normal stock DS DD disk drive.

But it seems that with the MEGA ST4 TOS 1.4 with stock internal
DS/DD drive I can only read/format DS/DD disks.

I was trying to read/format with the stock TOS 1.4 DeskTop. No other
disk formatting software or OS was tried.

Is this due to the TOS version or is something else causing this?
I thought that TOS 1.4 could format HIGH Density Disks into DS/DD
disks, maybe I am wrong on that.

Any help is appreciated.

I believe there have been some, but I'm afraid they don't work well with all programs... :(
Unfortunately, I can't remember any manufacturers of such things - maybe someone else?

> 2. Is TOS 2.06 the highest version one can use in the MSTE?

Yes - as far as I know...

> 3. Does one have to set any DIP switches or software settings to
> allow a DS external disk drive to work on a MSTE if you have a stock
> internal HIGH Density disk drive?

I believe it's switch 6 or 7 that should be changed (it's only one switch you have to change). You can easily see if it's the right one by choosing to format a disk. You'll see an option extra for HD formatting... Do the switching when the computer's turned off - and then boot up again to check if it was the right one...

> 4. Can one use newer type SCSI hard drives with the MegaSTE's internal
> SCSI board? What about CDROM and CDR SCSI devices, can these also be
> used with the internal SCSI board of the MSTE?

Most SCSI-1, SCSI-2 and Fast SCSI-2 should work. Use HDDriver to get the best compatibility, as many other drivers don't support drives that are too big... Avoid drives with bus arbitration!

> 5. Is there only one Chip that controls the internal and external
> floppy drives on the MSTE? What is the name of this chip or chips and
> where is it located?

There are a couple of chips involved, but mostly it's the WDC1772 and the DMA controller. Check out the schematics at... (searching old mails...) ah - found it:
http://www.fortunecity.com/skyscraper/quadra/455/ . As i recall it, the schematics are saved in some PC picture format, but there are tons of graphic converters out there...

>
> You can send him the info at
> smallroach@(remove this part for spam control)webtv.net
> or post here

You can use a regular PC drive even though the drive itself is an 1.44MB -drive. It will only work as a 720kB-drive, but it's much easier to find such a drive than an original drive.
The trick is to turn the flat ribbon cable - NOT THE POWER CABLE!!! - 180 degrees around (so that it doesn't fit the coding slot - some mild violence is probably needed...). You also have to set the drive to DS0 (Drive Select 0) with a jumper switch or soldering pad. As default, PC-drives are always set to DS1, which doesn't work with Atari machines. Check out that such a jumper or soldering pad is available on the drive before you buy, since not all drives have them...
In rare cases you may have a problem when you exchange disks in such a drive - and the directory of the old disk appears instead of the new disk's directory. In such cases, just press the Esc-button to send a "force media change" and the new one appears instead. There is a hardware solution for this rare problem, with a resistor and a capacitor, but I can't remember the values or where to connect them Someone else maybe remembers it?

This is quite normal - unfortunately :(
All drives follow Ataris' specs, but some go beyond the specs. This means that all drives will work with DD-disks and with a 720kB normal format. Very many drives can also handle HD-disks and strange formats (80/10 etc...), but some will never work properly with other than the "normal" operation :(
I believe EPSON drives (with a small eject-button at the lower right of the disk slot) didn't work with HD-disks, while Chinon drives (with a long eject-button centered below the disk slot) did (or was it the other way around...?).

>matter though, since I had problems with both computers.

>Gail

Hi Gail,

Well, I have quite alot of High Density type disks that I formatted
with the TOS 1.62 STE. I had just bought a package of 50 FujiFilm
2HD IBM Formatted 3 1/2 disks and they work just fine on my STE.
I have a GoldenImage Master 3S external drive hooked up to it and
use it mostly when formatting. But the stock internal STE drive
also works fine with these disks. I've never had a problem with
disks, until I starting messing around with this MegaST4 TOS 1.4.
This MegaST4 is stock and does have a Blitter chip.

At this point, I'm not sure if this has to do with the TOS versions
or the chip in the computers that controls the disk operations.
Maybe it is the drive mechs? I'd sure like to get this cleared up.

Does anyone know the answer to this?

First, if the CDROM was accessible from a file selector, SPIN certainly
was installed correctly. Why you haven't been able to configure your
desktop to show it is strange, but it certainly sounds unrelated to
SPIN.

Having said that, it's probably best to remove all traces of SPIN*.*,
META*.* and CONFIG.SYS and then to install one of the two drivers from
scratch. You have to look into MagiC's extension folder, the auto
folder, and the root folder of your boot drive...

Hi Pascal, and thank you for your suggestion. But the UsR 56K Voice Modem (such my former Sporster Flash has become after the upgrade to V90) is a Class 1 and 2.0 device. Besides my Straight-Fax 2.5 version (maybe the last one to be put on the market) works also in Class 1, so that is not the question... I take the opportunity to repeat my request: fellow Atarians, is there any of you who keeps on using Straight-Fax with 56K (UsR preferably) Modems? If so, which is your hardware and software setup?

Marco

No. It works great as a high density drive. Of course, the Mega Ste needs
to support high density drives. Some older ones don't.

>And when replacing Atari DS/DD drive mechs with High Density ones,
>Is there any brand or type that is better to use or do all of them

The Master 3S had a Teac DS/DD drive mechanism. I found a Teac high density
drive mechanism at a local computer store for $45; I could of found one
cheaper mail order though. It was a perfect fit in the Master 3S.

> What drivers do you use? Is "Glue" the DMA Chip?
>

Glue chip is quad form, 68 pin, end of sign is ...15-38, MMU's (other quad
chip) sign end is ... 12-38.
DMA chip is 40-pin DI, sign end is ...13-38. It's by chips in first series
of ST.

2849. Mega ST FD help?

Newsgroup: comp.sys.atari.st
Date: 1999-08-06 00:00:00 UTC
From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7oeqekhat2@news.campuscwix.net>
Source record: 75031

Okay, since yesterday, my 1987 Mega ST 4 (Tos 1.04/Adspeed) has developed a problem that I've not encountered before. (BTW, this is the Mega that runs DarkForce! so its been operating near continuously for nigh on 4-5 years now). Anyways, if I insert a floppy disk (any floppy - I've tried several including new and old ones), the computer immediately resets and cycles between accessing the floppy and resetting in a never-ending loop.

Is it time for a floppy disk drive replacement? <smile> If so, should I try to get a new one from some place like Best Electronics or would I be better off trying to find the same kind of drive in an old beat-up 1040 somewhere (cheap)? Thanks for any help! ;-)

Note that this is not critical - the Mega is still running my BBS, hard drives and CD-ROMs work just fine...just no floppy. ;-)

First thing what comes to my mind: did you connected power to IC 74LS03 ?
It's not on schematic, because it's self-understanding. So, you need to
connect pin 7 of 74LS03 to GND, and pin 14 to VCC (+5V) .

Did you connected lines A2, A3 & A4 from CPU to lines A0, A1 & A2 of IDE
in order as it's on scheme ?
A2 to A0, A3 to A1 and A4 to A2.

There is no general rule where to connect chips. It's not possible, because
we have many PCB layouts of Atari ST machines, with very different IC
arrangement. Good place for GAL is near to CPU. 74HCT245's you can put near
to IDE connector.

Sorry for bad STF schemes, but it's all what we have. I have also some
photo-copy, and mark-number's of IC's are different in every other PCB
version.

You asked about red squares at IDE connector. This shows orientation of
signal, we have also bi-directional lines - such are all data lines. Small
black square on some pins mean that it's not connected, as it's obvious.

TUP is Transistor Universal PNP. You can use every silicon PNP small power
transistor there. This abbrev. is used in most of electronic magazines.

I went into this, and the answer is as Kevin say's the original
host adapter cannot handle above 1 gig hard drives, and don't support
parity. System Solutions have more up to date host adapters for the
Mega STE that don't have the above restrictions.

Hi,
I don't know since I don't use AM, but normally SoundPool are very
helpful if you send an e-mail to them: info@soundpool.de
Maybe you should check out their Support area at their site first, to
see if there's anything on the topic: www.soundpool.de .

Best regards,
Claes

Hi Robert. I have a question out of simple curiosity. With the
C2's power, can't you run that same resolution in True Color?
Running a fairly hi-res (higher than 640 x 480, which I can get
with my Nemesis) desktop with TC is one of the better things
that I would have thought the C2 would make available...

Thanks for any info!

No, DB master one was a database I believe developed in Britian.
DBman was done by Versasoft I believe was the name of the company
which also made it for PC, Unix and other platforms as a DBIII
compatible database program. Once knew a Atari/Amiga/PC dealer that
had created her inventory and accounting setup using DBman.
I have a copy here somewhere, never got to play with it enough
to learn it all that well.

I've got a FAD2/2 made by the same people and it is fantastic....Sorry it's not for sale but I'd wholeheartedly recommend the LineAudio stuff as it's all based on the same basic circuitry, the JAM things have balanced inputs and the FAD's don't....they do everything from a 2 I/P-no-O/P device to a rackmounted 8 I/P-8 O/P one....fit one and stop worrying about the quality of your recorded sound...

Source record: 74953

I still like to use a statistics program called bSTat and would like to be able to take it with me when I travel. I have PowerPC, and would like to install STe emulation software.

What is available - and what is considered the easiest to install and use?

Thanks for the help.

Atari user since 1982 - with a Mega STe in daily operation.

Terry

Why, good question;)

When I am coming across certain packages, I am collecting them for
future reference for other Atari users in the future. Ironically I've
had ALL the programs for STOS and sold them as I thought there were
plenty around.

I do like to have software in the original packaging as it helps me
locate it easier if needed; easier to find a box with STOS 3D on it than
a disk and manual!

No help, but tell me more about Dr. T emulation on PC. I called the company about six months ago and they were not in business. I also called Emile Tobenfeld's number and left a message but never heard back.

I've got tons of KCS and Copyist files that I would like to transfer to some currently supported environment. At least I'd like to emulate if that's possible. If you know anything about this please respond.

Al.

2880. Using an SCSI Atari formated drive on Magic Mac

Newsgroup: comp.sys.atari.st
Date: 1999-08-07 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <7ohkhk$32li$1@spnode25.nerdc.ufl.edu>
Source record: 74963

Ok, I finally can use my Quantum scsi drive with Magic Mac. This is usefull
as I can now very easily transfer my AIFF files from Logic Audio and Cubase Audio to
the Mac and then make my cds. Also, I can use this method to backup all my
Falcon files using TOAST on The Mac.

All I did was to select on the Magic Mac Util. the SCSI number for the scsi
drive and then on Magic Mac desktop "Install Devices". From the Magic Desktop
I can then copy all the Falcon files to the Mac's Internal HD :)
One thing, the scsi internal drive in the Mac is set to scsi #0 so I had to change my
Falcon's
drive to scsi #1.

I used to use HD disk on my 1040 STFM (Tos 1.2)and my STE (Tos
1.62) formatted to DD standards with no problems but a mate could
not format the HD disks with his STE (Tos 1.62) It looked like the
disks did not like some drives.

I've seen this before, but can't recall the cause. Best is rather
pricey, so if you can sacrifice a 1040 for the floppy, much better, or
an SF314. The slanted face plate with the large center ejector is
somewhat less common though....

Source record: 74971

I reformatted the SCSI drive under DOS 6 as this format is supported by
HD Driver under MagiC. I have no trouble accessing this drive by the PC
or the Falcon, though Windows sometimes gives and error message if I
don't turn off the Falcon first.

Thought I read an announcment that all Dr. T Atari software were going into public domain, and were supposed to be posted on Emile's web site for download. The downside to all ST emulators is that none to my knowledge support the MIDI port.

>Regards, Robert
>

I don't know what the A version of the CT2 can do, But I do know that
with the CT2 B version 800x600 in TrueColor on a SVGA Monitor works
well.

I use 800x600 in TC mode quite often and it is as clear and stable as
640x480 in 16 colors normal Falcon Mode.

My 17inch SVGA Monitor will only Sync down to a Horizontial of
30kHz and I get 800x600 in TrueColor Mode right around a Horizontial
frequency of 29kHz using CentScreen and CentVidel. This is pushing
my SVGA abit but it works just fine. Also I use the MultiSync DATA
file with CentScreen/CentVidel.

In 256 color Mode I have went as high as 1280x960 and 1280x1280 and
these modes work excellent as well, very stable and clear.
I know I can achieve higher Resolution that 1280x1280 cause I still
have frequency BandWith to Play with in CentVidel before it Maxes out
at my SVGA monitors Frequency Limit.

Now if I had a True MultiSync Monitor that would Sync Down to 15kHz,
I am sure that 1024x768 in True Color Mode would be Possible. Maybe
even 1280x960 in True Color which would be nice. But 800x600 works
very well for me. Using programs like TruePaint and etc in 800x600 TC
is very nice. And it is still much faster than a stock Falcon in
640x480 16 color mode!

At first I didn't think I could get 800x600 TC mode with my SVGA.
But CentVidel will allow you to set the Horizontial and Verticle
Frequencys 1kHz at a time. So I had to play with the settings
before I got it right. Again I had to set the Horizontial around
29.xxxkHz before I found the right frequency but it does work
extremely well. I see no need for a Graphics Card at this point
with the CT2B. Maybe I'll get a good MultiSync one day and see
just how far one can go in True Color Mode.

Does any CT2 owners out there have a Multi Sync Monitor, if so just how high can you go in TC Mode with your CT2?

2891. Midi Sequencer for Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-08-07 00:00:00 UTC
From: broncos@primenet.com
Message-ID: <7oi59fbch1@nnrp02.primenet.com>
Source record: 74974

Does anyone know where I can pick up a midi sequencer for my falcon
I have been using kcs omega but unfortantley it will only work in st high mode. I want something made specifically for the falcon or something that will run in 800 x 592 (centscreen) resolution. It does not have to be in color But I hate the low resolution stuff. If anyone knows if Notator or Cubase score will work at higher resolutions on the falcon then please let me know. If anyone can point me the way to Cubase audio or Emagics Logic Audio then please do.

Gene

Hi John. Yes, I've noticed that Brads' prices are a little bit on the high side sometimes. I've actually got a couple of 1040's lying around (for spare parts), so sometime this weekend I'm going to pull one of those floppies and swap out.

Thanks for the advice! ;-)

Hi everyone.

I recently picked up some atari equip from various thrift stores but
am having troubles getting any disk to read or format.

I have tried 4 different SF354's, and 3 Different 520ST's and 1 5 1/4
drive (some generic drive someone made i believe)

I have the most success with the 5 1/4 as it will read some disks, but
will not format. The format status bar will reach the end then it
will give me an error message, even though these disks are fine
(tested on my PC).

With the 354's, nothing will read and format wont even format a track.
I cant see 4 drives and 3 systems all being bad though.

Does atari need special disks ? Ive tried HD and DD.
Is there a better format program other than the one built into the OS
??
Arer atari drive notorious for breaking down ??

Any help would be appreciated.

Thanks

The SF354 is a single sided drive. The DD should work fine. There are
many other disk utilities try one like Fast Copy III is was alot fast then
TOS. Can be found at UMICH

>
> Arer atari drive notorious for breaking down ??

Ive never had a problem with them I have about 7 of them that work great.

I have an early SC1224 for sale. The case is a little dirty, but its works great. Looking for a good offer.

Also have an 520st with a 4 meg zram upgrade(case bulges a bit open) and a ssdd and dsdd drives. Also a Megafile 30 in great shape. And one more thing a Golden Image Hand scanner Black and white. It is in good shape, except there is a break in the power cord someplace and sometimes needs a little wiggling to get it working. Will take any decent offers.

Please email offers

oh my goodness, he's been iMaced! :)

actually, you could try to get ahold of a Sony hi-density unit and use
that in the Mega - I believe that Ken, the TAF president, installed one
of these in a 1040 and it works great, the button even mathes up with the
holes on the body so you won't have to carve up the front.

2901. [HELP] PC-Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 1999-08-08 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <7okl11$2dk$1@nnrp1.deja.com>
Source record: 74898

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

The final clearout - continued!

Amazingly, I still keep finding surplus and duplicate copies of various Atari software, mags and bits and bobs which could do with finding a good home soon!

I'm open to offers on any or all of the following items. Postage & packing is extra, but charged at cost. Or items can be collected in person from Sheffield.

Atari Software:
Polytype Font Designer - design Calamus and Pagestream fonts.
GENUS Font Designer - design Calamus fonts.
Home Accounts - version 1.
1st Mail - mail merge package for use with 1st Word Plus.
Oxford Chess - chess program!
Easytext Pro - vector font DTP package.
CompoScript - Postscript interpreter for Atari.
Timeworks Publisher 2 DTP - manual and disks.
MAGE - Majic Arcade Graphics Engine - design quality games in GFA Basic, full package with manual, GFA Basic, sprite disks and extras. *Rare*

Atari Magazines with cover disks:
ST Review - 12, 13, 14, 15, 16, 17, 19, 20, 21, 22, 23, 24, 26, 27.

Atari Magazines without cover disks:
ST Review - 18, 35.
Atari World - 1, 2, 4.
ST Applications - 54.
ST Format - 48, 52, 53, 54, 55, 56, 57, 59, 62, 68, 69.

Atari Cover Disks (no mags):
ST Review - 6 (2 disks), 7 (2 disks), 8 (2 disks), 9 (2 disks), 10 (2 disks), 11 (2 disks), 21, 26, 27, 30, 33 (only disk 1)
ST Format: 14, 15, 16, 18, 19, 20, 21, 22, 23, 25, 26, 27, 29, 30, 31, 32, 39, 40, 41, 52, 53.

Atari Software Manuals (no disks):
That's Write v1.5 manual
ST Basic - sourcebook and tutorial
STOS manual (3 copies)
Discovery Pack manual for Neochrome, First Basic, ST Tour, Utilities and more.

Misc:
Atari/Syquest 44MB Megafile cartridge

Atari Games:
Various - list in preparation, ask for details if you're interested.

Email: publish@cix.co.uk

Kind regards

Mike Kerslake

2907. Desktop icon for zip drive partitions... ?

Newsgroup: comp.sys.atari.st
Date: 1999-08-08 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37ADF6B9.6D59@geocities.com>
Source record: 74904

Hey folks, Thanks to the innovation of the ICD cables and software I
was able to set up a zip drive for backing up my scsi hard drive. Now I
have a few questions if all of you don't mind:

1) can a zip disk become the main bootable hard drive?

2) Now that I have a zip disk working through my scsi drive, I am
trying to get it so that I can access all the drives on the zip drive
and scsi drive. This is on a single TOS system (1.04).
Right now, the partitions C through E show up for the scsi drive.
Drives F through J do not show up as icons.
With a TOS 2.06 system you can manually select a drive using the
[control] (drive letter) command. But with my main system, with the
1.04 system, this trick cannont be used.
However, I have found I can SELECT files THROUGH programs, like word
processors, Movie Player, conpression programs, ect.

But really, how can I set up icons for zip drive partitions that I can
click FROM THE DESKTOP?

3) How can I connect a scsi zip disk through a hard drive on the asci
format using neodesk? (Need to back this drive up real bad...)

Thanks in advance!

Doctor Clu

As I already wrote in another posting, that's not correct: Without
additional software supporting it (e.g. Thing), TOS2GEM won't do
anything. It just offers a service to be used by applications.

Ciao

Hi Dan,

D>I have tried 4 different SF354's, and 3 Different 520ST's and 1 5 1/4
D>drive (some generic drive someone made i believe)
if I remember correctly my ST times ('88), the SF 354 is single sided drive and the corresponding 314 the double sided one.

For the 5.25" drive you'll have to change the stepping time from 3 to 6 milli-seconds.

D>Does atari need special disks ? Ive tried HD and DD.
No, it will read both Atari and PC formatted disks.

D>Is there a better format program other than the one built into the OS ??
Yes, I don't know anybody who uses the buit-in routines. Try PROCOPY, FASTCOPY, KOBOLD or thousands (o.k. dozens) of programs.

D>Arer atari drive notorious for breaking down ??
No. The original Atari drives were mnufactured by Chinon and Epson, as far as I remember, and you may try them with a PC, if correctly jumpered.

Is your floppy controller right? You may try any floppy formatted on a PC if it's not a HD one. And even a HD floppy disk may be used as a DD one if you tape the "selection hole".

2913. TT SCSI Drive hookup

Newsgroup: comp.sys.atari.st
Date: 1999-08-08 00:00:00 UTC
From: Schoengarth <dons@qnet.com>
Message-ID: <37AE6466.604EEBE2@qnet.com>
Source record: 74910

I asked this question awhile back but, didnt get the answer for what I was trying to do.

I have a TT with 160meg hard drive. Now I want to add another 160 meg hard drive to the TT. Here is where I think I confused everyone. I bought a new SCSI (24" double header ribbon cable). I want to hookup both drives on the same ribbon cable. The second drive will receive its power from another source. Both drives will be on the same cable that is connected to the TT motherboard.

How do I get this to work? is there a special length of cable needed to do this? can it be done?

I have tried everything. Maybe its my teminations I have the TT and the last drive terminated.

Any help is appreciated.

Don

Hi Dan,

D>
D>Still cant get the 5 1/4 to work though. It was brand new when i got
D>it. Does the 520 ST support 5 1/4 properly ??
yes it does. But make sure it's correctly jumpered (e.g. as drive B:)

D>Mabye its looking at it like a 3 1/2 drive ?
Yes that's the point I answered to in my parallel mail (stepping speed
should be adjusted)

D>One final question, has anyone succeded in getting IBM HD to read
D>single sided DD formatted disks ?? If so, how ??
Yes, 360KB should be 40 tracks a 9 sectors. So at least, the other way
round should work: Format the disk on a PC and get it over to the ST.

Generally the ataris do accept nearly any PC formatted floppy disk
whereas sometimes you may run into problems when trying to read a disk
on PC formatted on a second one.

I do have a ICD Link II that I could use with it.

>
>Er!, depends what you mean by control, there's about 3 (control)
>chips that get a say in what the drives are doing.

Mosly I am interested in the chip or chips that control the
Formatting and read/write of the internal drive.
I have a High Density Internal Floppy and it is not working
correcly. I suspect that it is the Floppy Drives ribbon cable
because it is bent and twisted very badly. I'm going to replace
that first. Since the external Disk Drive does seem to work
fine, I guess the Floppy drives chips are ok. Unless there is
a seperate chip for the internal and external floppy drives.

>Kool Dude!!..
>
>Laters!.

Thanks to all that has helped answer questions and etc regarding
the MSTE.

Now, I have another question regarding the MegaSTE and
a AlberTT card. When using the AlberTT card. Should I see anything
on the monitor when I first turn the MegaSTE on. Or do I have to
wait until the Drivers for the AlberTT card are loaded before I get
a Video Display?

Previously...

One final question, has anyone succeded in getting IBM HD to read
single sided DD formatted disks ?? If so, how ??

@>-->-------------------------

First off, welcome to the world of Atari. I have been using an ST
since about February of this year and I find it a fun system. Mainly
for desktop publishing, BBS'ing, movie playing, and internet surfing.
And it becomes more and more useful as time goes on.

Your floppy drive question is simple. I don't believe a single density
(360 K) disk will work unless you have the proper disk utility on the
PC to read it.
But if you can secure a 720 K disk drive, then you have it made.
Either format the disk on the PC first, or find the special utility that
allows you to format a IBM PC disk. FRom there, no problem, the Atari
was designed to read PC disks from the get go. :)

Take care!

Hi everyone...

I've really become quite interested in chip-music lately, and especially in the
techniques used to improve the sound quality of the YM2149 chip beyond what it
is supposed to be capable of. I'm talking of things like SID-voice, buzzsounds,
digidrums etc. I've looked at various chip-music composing programs, but none
of them give any explanation of how these effects are achieved. So can anyone
out there explain these (and any other) techniques to me please? Don't worry
about getting too technical, I want *all* the gory details :) Also let me know
if there's any sites or docs I should take a look at.

Thanks in advance,
Dale.

Hi

That's a little drastic really. All you need is to get hold of the ICD
floppy disk and boot the hard disk driver from floppy, move the relevant
file over or make it bootable again!

If no one helps, drop me a line and I'll help sort it out:)

I'm not sure what's supposed to be possible with the latest edition
of HD driver, but under MagicMac you should be able to read your SCSI
atari HD (AHDI compatible) from the Atari side of the Mac. You won't
be able mount it on the Mac side. Select the option to install
drives on your desktop while on the Atari side and your Atari HD
should appear as the next available drive letter. Once the stuff is
copied to the Mac hard disk you will be able to access any files from
the Mac side.

From: tkelly@pressenter.com
Message-ID: <7onjhmsjd2@jair.pressenter.com>
Source record: 74847

I posted here several months ago looking for help on my dead TTM195 19 inch BW monitor. It went completely dead after working fine for about two years or so. The power led does not light. The fuse is OK. I've finally had some time to dismantle the monitor, and I can't see any obvious burned areas. I remember reading references to the "flyback transformer" but have no idea what component that is. There is a transformer by the power supply area on the right side of the board (from the rear) and there is something which might be a transformer on the left side which has a high voltage wire coming out of it that attaches to the CRT.

Does anyone know what to look for when the TTM195 fails? I remember references to a repair guide by Berne Diotte but I don't know where to locate that.

Any help would be appreciated.

Terry Kelly

http://atari-computer.de/xonline/ moves to http://place2be.de/

Hi!

After exactly one year (August 9th 1998 - August 9th 1999) as a constant news service and allround Atari site 'The X' closes its' doors and instead the new 'place 2 be' opens.

Well, why did I make this decision?

I got a cheap offer for my own top level domain name and I simply couldn't resist. While checking for some suitable x like top level domain names I came across a big bunch of either X-Rated or X-Files related websites with no suitable name left for my little X. So I decided to go for a new name.

So what will change besides the name?

Currently nothing but there are some new sections and services (now possible with the new server) that will be added in the near future.

So what do I have to change in my Hotlist, Bookmarks, Favorites ...?

For the German pages use either
http://place2be.de/ or http://www.place2be.de/

For the English pages add indexe.htm so use either
http://place2be.de/indexe.htm or http://www.place2be.de/indexe.htm

I'm currently evaluating the possibility of using e.g. a .com address for the english pages but in the meantime I'm going to register a short subdomain at ATARI.ORG.

Anything left?

I want to use this opportunity to inform you about the CAB campaign that has been started a while ago. The 'Most Wanted' section of my page allows you to vote for a new CAB version and the count is currently at about 70 so there is much room for improvement left.:-) So if you haven't yet voted go to my site and do so.

Regards,
Jan

Have you tried the MegaTracker Player ?
Now it's freeware and you can find the last version (1.15) on most
FTP sites.

Bye

Hello there,

I've downloaded GT Look 2, as it is freeware, and
I wanted to try it with the parallel scanner I'm
using on PC. It's an Epson GT 5000.
But it seems GT Look 2 doesn't want to recognize
my parallel scanner... When I click to start
the program, the red "Error" light of the scanner
switches on...

Errr... in fact I'm not sure GT Look 2 can use a
parallel scanner... what can I do ???

Thanks !

From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7ol8i5$3lh$1@news.campuscwix.net>
Source record: 74914

Okay, after stripping the PS and floppy drive from an older 1040STf, and swapping back and forth with my problematic Mega's PS and FD, I have found that my problem is indeed, the power supply. The old PS had brown marks/burnt smell on the yellow colored tower (transistor, I guess? It had wire wrap). Anyways swapping floppies didn't make any difference, but swapping PS's did. So now I'm going to order a Mega ST PS from Best Electronics. I'd use the 1040's, but it doesn't have the fan attachment, and I figure a new one is the best way to go... ;-)

Thanks to everyone for their help/suggestions!

PS DarkForce will still be accessible, running on a 4 meg 1040STe, just slower... (the Mega runs at 16mhz)

Source record: 74915

On 8 Aug 1999 17:29:30 -, Doctor Clu wrote:

-> 1) can a zip disk become the main bootable hard drive?

Not sure about this. I know you can make an EZ 135/230 into
a bootable device. Seems like you should be able to...

-> 2) Now that I have a zip disk working through my scsi drive, I am
->trying to get it so that I can access all the drives on the zip drive
->and scsi drive. This is on a single TOS system (1.04).
-> Right now, the partitions C through E show up for the scsi drive.
->Drives F through J do not show up as icons.

Only the partitions that -exist- will be available for the icons.
Surely you don't have the Zip drive divided up into partitions
ranging from F thru J? (or am I misunderstanding what you are
saying?) The Zip drive should ideally only be 1 or 2 partitions.

-> With a TOS 2.06 system you can manually select a drive using the
->[control] (drive letter) command. But with my main system, with the
->1.04 system, this trick cannont be used.

From TOS 2.05 and up, you can select "Install all devices" and it
will put an icon for each legitimate device that the system found
when booting up.

Before TOS 2.05, you have to select the last icon that you can see
in the chain, (for example "E"), highlighting it, then pick install
drive from the drop-down menu. Give it the next letter (F) as an
assignment, then it should appear. Go through each of your remaining
partitions like this...

Don't forget to save your desktop after you get everything in place!

;-)

-> 3) How can I connect a scsi zip disk through a hard drive on the asci
->format using neodesk? (Need to back this drive up real bad...)

I used to use Geneva/Neodesk. Been awhile, but if I remember correctly,
it will find your partitions once you have them setup correctly in
TOS... Also, I think it has some kind of drop-down menu command that is
similiar to "install all devices".

Again, if I'm understanding your question right...

Hope this helps! ;-)

Is there anyway to have TOS (1.02 I think) recognise more than 2 drives.

Also, do you think it would be worth it for me to sink much effort in upgrading a 520 or should i just try to hunt down a 1040 or better ?

>last drive terminated.

Hi Dan,

nope, you haven't tried everything, it would have started to work then :-)

Now I wonder what you mean by "both drives will be on the same cable that
is connected to the TT mb"

Right, this is possible, then remove the termination from the first drive
on the cable and enable termination on the last drive on the cable. You
gotta adapt the cable for that, since it has only one connector...

A more convenient way is making use of the external SCSI socket on the
backside of the casing. I gather your first HD sits inside. You just leave
it there (PS is there any room for your 2nd drive inside???). Also leave
it terminated. Next hook up your 2nd drive to the SCSI socket. In that
case the 2nd drive needs to be terminated as well and you have to remove
the internal terminators in the TT.

I got the impression you want to use the internal flatcable to hookup 2
drives. In fact you only need to add another connector.

To summarize: as soon as you start using the SCSI outlet on the TT
combined with an internal HD on the flatcable you have to remove the
internal terminators from the motherboard. If you use only an internal HD
on the flatcable the terminators should stay in.
On one flatcable you can connect many devices. The physical last one on
the "chain" needs termination, the others don't. Now that's the theory,
but some TT's appearently develop strange habits with termination, so if
it doesn't work, you gotta use the "trial-and-error" method... which
should start by putting back the internal TT terminators once you removed
these...

HTH,

Some time ago the last Atari version got a link... is the author ashamed
of his roots?

> > Can anyone point me in the right direction?
Just get the last (AFAIK) version of the tracker:
ftp://ftp.lip6.fr/pub/atari/Falcon/Music/gtk08665.lzh. It's obviously its
format's best player :-)... Some say it's also the best XM replayer for
Falcon. And there is a separate format-conversion program too.

> Have you tried the MegaTracker Player ?
> Now it's freeware and you can find the last version (1.15) on most
> FTP sites.
I'm afraid this one doesn't even replay GTK modules (first Graoumf
format version). According to what is stated in the docs, it was planned but
will sadly never be implemented (as development has ended). BTW if you want
the latest and last (freeware) version of the MegaPlayer (the best for all
formats but XM... and Graoumf Tracker's), look for 1.16: same as 1.15 but
registered.

Bye,
G.

To Stephane: Hey Beast, a few questions 2u:
- how come your YM-player doesn't work on my bare Falcon? Checked the
source but can't figure out why sound didn't come out (no crash though). And
yes I think I have check the ADC-matrix thing too...
- will u go 2 the RTS2?
- done w/ the army?
Nice and fun 2 speak 2u in English... please answer soon by e-mail... in
French!

D> So now I'm going to order a Mega ST PS from Best Electronics.

I've got a Mega ST4 Power Supply in very good shape I'll let you have for $25 plus $5 for shipping.

It was a spare power supply for my Bear Cavern BBS (360 573-2054), a Mega ST4. Later the ST4 was replaced with a Mega STe. The PS is now surplus.

The Games clearout!

I'm open to offers on any or all of the following items. Postage & packing is extra, but charged at cost. Or items can be collected in person from Sheffield.

All games suitable for Atari ST, all require a colour monitor/TV, although a couple will run in mono. All with proper manuals where required, packaging and original disks.

Games Software:
Borodino/Armada (twin pack) - war/strategy)
Borodino (on its own!)
Terrorpods
Xenon - shoot em up
Zombi
Italia 90 - football
Wild Streets
Legend of the Sword
Warlock's Quest
Italy 1990 - football
Uninvited - Gothic horror
Phantasm - shoot em up
Goldrunner 2 - space shoot em up
Lotus Esprit Turbo Challenge - racing car game
Jewel of Darkness - three adventures using logical thought and puzzle solving
League Challenge - football league management simulation
Crazy Cars
Mach 3 - arcade game
Galdregons Domain
Foundations Waste
The Dream Team - three games; The Simpsons Bart vs the Space Mutants, Wrestlemania, Terminator 2 Judgement day
Dark Castle

Go on, make an offer for any or all of the above!

Email: publish@cix.co.uk

Kind regards

Mike Kerslake

2951. Atari ST (Toad) HD in PC?

Newsgroup: comp.sys.atari.st
Date: 1999-08-09 00:00:00 UTC
From: Brian Whitman <bwhitman@wpi.edu>
Message-ID: <Pine.OSF.4.10.9908091326340.25734-100000@wpi.WPI.EDU>
Source record: 74930

I have a Toad 50MB scsi harddrive hooked up to my ST through an ICD Link adapter (old style...) I would really like to get all these files on it over to my PC so I can burn an archival CD-R for safekeeping. (The CD-R won't work on my ST, the ICD link doesn't handle parity)

Anyway, can I just take this 50MB drive and stick in my PC's SCSI chain? The drive has 4 partitions. Will the PC be able to read it and get the 4 partitions?

I'd try it out right except I am afraid it'll destroy the data on the disk. I don't want this to happen--

any help would be appreciated. Thanks!
-brian

2954. Link2>Syquest EZ230 problems

Newsgroup: comp.sys.atari.st
Date: 1999-08-09 00:00:00 UTC
From: techho@my-deja.com
Message-ID: <7onab1tsi1@nnrp1.deja.com>
Source record: 74933

Hello,
I'm having problems w/ my harddrive setup on my STe.
I'm currently using ICD Link 2 w/a Syquest EZ flyer 230.
Usually after I format and use the drive a couple of times I start to
get an '$MSense' message on the upper right hand corner of the screen,
after this point the drive seems unable to access data and usually comes
up with a 'unable to access, drive may be damaged' message. I've tried
mapping and zeroing out all the partitions w/ HD Utilities, and
reformatting. This continues to happen consistently after a few boots.
Is this a hardware or media problem? should I just try formatting a
fresh disk? Any thoughts appreciated. Thanks.

:-)) Dead right, Louis. I have one internal HD and a whole bunch of SCSI devices external the last of which is terminated. This configuration goes MAD unless I put back the internal bus termination. Don't ask me why!! The laws of physics don't seem to apply here :-)

Do you mean floppies or HDs? Generally TOS will install 16 drive devices A:
to P:. Other systems, Magic and MiNT, will allow more to be attached.

> Also, do you think it would be worth it for me to sink much effort in
> upgrading a 520 or should i just try to hunt down a 1040 or better ?

I guess you could probably buy a 1040 for the same price as a RAM upgrade
nowadays.

This is likely to be a bit expensive. Why not try replacing the brown,
smelly bit first ? :-)

... or, you could use an old PC power supply externally if you don't mind
the wires. These can be had for next to nothing.

Hi Yann,

Logic Audio 2.01 and Logic 2.01 are the programs, but (last I've heard) you still need the LOG3 dongle to be able to run them. Also, I'm not sure, but I think the ftp site does not have the fonts, etc. I may be wrong about that - it's been awhile since I've been there. But I could help you out there anyway - I have Logic 2.0, 2.01, 2.5, and Logic Audio 2.01. Not having a manual could make things.... difficult. ;-)

The ftp sites:

dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI
(I think this is where the programs are. On some PC browsers, you may have trouble getting to this one because the address doesn't start with "ftp". I know of one fellow who had success using an ftp program called (I think) "Bulletproof Ftp".)

ftp.mcc.ac.uk/pub/music/emagic/LOGIC
(Not sure what's here.)

ftp.emagic.de
(Maybe worth a "look-see")

If anyone knows differently, please let me (us) know. Since they no longer have anything to do with Atari, it would be nice if Emagic released all Atari software to the public, without the need for a dongle, etc. Especially since Ataris are where they got their start!!!!

Good luck, and let me know if I can be of further assistance. (and thanx for the Reservoir Gods address)

There is a minimum distance of 20 cm between connections on the SCSI-
bus.
Further: somehow the internal SCSI connection in TT is only working
good for the majority of people with one drive connected. Just as
you: trouble when trying 2.
Why? Ask Atari...

The LAN port is sadly under-utilised. I'm surprised no-one has coded an Appletalk compatible network layer to connect to a Localtalk Mac network or similar. Its a waste of hardware really, but at least its there if some coder wishes to do a wee project like that (hint!)...;^)

Hi Gordy

Under "options" you've got "sound settings" and there you must point to
the sound you want to use for a specific event and then click on "use
sound" and "use Gemjing". I hope i remember correctly.

Source record: 74851

Terence Kelly <tkelly@pressenter.com> wrote:
: I posted here several months ago looking for help on my dead TTM195
: 19 inch BW monitor. It went completely dead after working fine
: for about two years or so. The power led does not light.

Well, the power LED is lit from a -6.5 volt supply, which seems to
come from a TV-type IC, marked TDA2553A. That does not mean there
is anything wrong with it, but such chips are usually cheap.

And, there are, on the circuit digram I paid a small fortune for,
power supply outputs of 62 v, 58 v, 27 v, 12 v, GND, -6.3 v, and
sync, and each of them should be there, and each is protected by a
zero ohm resistor used as a fuse. In the same order, these are
said to be marked LK 162, 163, 164, 167, 161, 165, and 168.

That gives you seven voltages and eight more fuses to check.
The large black square thing is the power transformer. Those
LK-numbers are between it and front board edge.

That IC is IC301, and is on the same end of the main board as the
lump with the thick wire to the CRT, about a quarter of the way
from the front.

So far, seems to me that you have lost one or more power supply
voltages. This monitor is 1990 TV-set technology, and most of the
parts are common industry parts.

Check those fuse resistors, then tack solder some long wires
in place on them, put things back together, and measure for
power supply voltages. What you find determines what you do
next.

: Does anyone know what to look for when the TTM195 fails? I remember
: references to a repair guide by Berne Diotte but I don't know where
: to locate that.

That was about Q205 and Q206, horizontal drivers, left rear corner,
and not a problem, yet. You either lost an IC or a power supply.

16 Verbatim 200mb disks for Syquest 5.25" drives, brand new, Mac
formatted (but this can easily be changed). $20 apiece plus shipping from
Colorado, $15 apiece if you take them all.

I run seti@home on a 200mmx. Completed 13 units
Guess I'm slow at about 108 hrs/unit.

>laws of physics don't seem to apply here :-)

Hi Roger,

yes, that's what I heard too. I've got one internal Quantum terminated,
and another Quantum, a Seagate, a Syquest removable and CD-ROM externally,
the CD-ROM is terminated as the last one and the internal terminators
removed. Works flawless from day 1.
I seem to recall that Dennis Vermeire once wrote he had 2 TT's (I even
believe he said identical ones) where on set 1 he had to remove the
terminators and exactly the same setup on set 2 he had to put them back
in... Then there's the stuff from people who needed an extra active
terminator on the end since "term enable" on the last drive wouldn't
work... So go figure! :-) Just now I read from Ronald that some TT's won't
allow for more than 1 device on the internal flatcable. If you look at it
that way it's still an ACSI bus :-)))

>
> Any help is appreciated.

Don,

I'm not sure about the TT, but on Mega/MegaE computers you cannot attach a second drive to the internal host adapter.

It's more advisable to put the second drive in an external case and use the SCSI port on the TT to connect it up. The SCSI port does not need a host adapter, and the connection is rock solid on my TT. I know that this isn't the way you want to connect it, but it's probably the most reliable and easiest.

Maybe someone else will jump in here and have better news for you.

Take care,

> fresh disk? Any thoughts appreciated. Thanks.

Well, I'd bet on an electrical problem. Check the cabling and the drive termination. If you have another disc to hand yoou could try formatting and accessing it - it would, at least, give a steer on whether it was a media problem.

->
->
->.

I'm not sure but I think you would really need a 4 meg setup
to get the best out of a basic MiNT installation. To be sure,
if you are gonna run replacement AES's, desktops, and more,
then you'll need more Ram than that... (hard on a 520ST).

How 'bout upgrading? 2nd hand TT's and Falcons are pretty
cheap these days... ;-)

Thanks for that....I had already set this bit up but still it would
not work.I then discovered that I had not put in the enviroment
varible GEMJINGPATH in my Magx.inf file once set it works
perfectly.The problem was MyMail could not find GEMJING and load in
the sound.

Contrary to what some might say, I could *not* access reliably HD drives
in my Mega STE until I fitted an AJAX controller. With that component
fitted, I never had a problem. It seems that some stock
controllers can cope with 1.4M, but not all. The DIP switch only enables
the HD formatting option in TOS 2.0x, it will not solve an access problem.

On my Hades there is a GT6500 scanner connected to the printerport. With the older GTLOOK II v1.0 there is no problem to use the scanner. However with the latest GTLOOK version I'm unable to use it.

When I start the program, that is v1.0, the scanner usualy return me an error message but after resetting the scanner everything works just fine. To use the GT range scanners on the printerport of a TT030 you must do a little soldering inside the TT030. I don't know however what exactly but it's certainly a very small operation. The manual says that one must make a connection by means of a small wire between PIN 14 of the soundchip and PIN 17 of the Centronics port. If one must do that on other types of machines I don't know.
It's certainly not needed on the Hades.

I just bought a couple of these drives. The only thing I can add is that
they self-terminate, so that is unlikely to be the problem.

Good luck. :)

well Boys,
I can tell you that it's possible to hook two harddisks on the internal SCSI flatcable ! I have in my TT Tower a Seagate Baracuda SCSI 3 as first drive on the internal flatcable, this cable had a loose end, so my dealer terminated this end with a passive terminator. Yesterday I removed this terminator and hooked a Seagate ST3620N on this loose end .I removed the resistor terminators on this drive, but I'm certain that doesn't matter..What matters is Term Power and my both harddisk have this option....cause months ago I hooked my Mustek scanner to this loose end and after that I tried my CDROM player but NO, SIR !! That doesn't work because these devices have no Term Power.
Now these two Seagates work wonderful together and I have 2.6 Gb altogether....
On my SCSI external port I have my CDROM Pioneer drive and after that my scanner. The last one has a terminator on its second SCSI outbus. All works flawlessly !I only want to use my ACSI/DMA bus and my Link adaptor, that combination works only for my harddisk with Term Power, but the solution which I described above is much more smoother and uses less cable !
Jos

2994. Re: 'Team Atari' SETI search

It probably depends how you run the Seti program. ie. as a screensaver or all the time.
I run it on two pcs (home is a PIII 450mhz, and work is a PII (not sure of speed, either 350 or 400 or so). At work I run NT and hence run the NT command line version. On either PC it now takes about 10.5 to 12 hours to do a block. This is with 1.06 on the home W98 machine.
Are you sure you're using the latest version of the seti prog? Before 1.05 mine used to take about 24 hours per block, as of 1.05 it's halfed.

Hi Roman,

R>Are graphic cards for ST ,which expand the resolution and no of
R>colours? Could I connect they to VGA monitor? Are they expansive? (
R>falcon will be cheaper?)
the Mega ST provides a VME bus. And even for the "smaller" STs there
are solutions, but where to get the hardware??

R>(falcon will be cheaper?)
Mybe not, but certainly easier to handle with.

Peter

Hi Roger,

RC>This configuration goes MAD unless I put back the internal bus
RC>termination.
according to SCSI theory my internal HD is terminated, the TT itself
is not, and the last external device is! And it works properly!

But, of course, I'm forced to keep (at least) one external device
attached and switched on. And this one has to provide term power!

That's a difficult thing for a programmer - demo versions need to be crippled in a way and disabling the "Save" option in a web browser doesn't make much sense.

> Now I'm running in TC here
> and it won't run in TC.

Then mail it to Jens: jheitmann@debitel.net .

>
> Matthias, with all due respect, this is IMHO NOT the way programmers
> should proceed. Same bloody stuff with ASH, they come up with Emailer
> which needs its own stack.

By the time Adamas was developed the Atari TCP/IP stacks were in an early stage of development. I don't like the 5 (IConnect, Sting, MintNet, Wensuite, Draconis) TCP/IP situation on the Atari either and it's being criticized in my reviews (in the German ST mag) of both Fiffi, Draconis etc. . However, there will be gateways (at least for Draconis) to use Sting/MintNet applications this year.
I don't think that ASH, Oxo or Mucs will be giving up their own TCP/IP stacks because they are designed to be a reason to buy the software.

>Yep, you can use Fiffi then but if you don't

Draconis: Telnet and IRC - yes. There is currently no Gopher client.

Well, some former Atari companies have succeed on Mac/PC (Emagic,
Steinberg) and some not (GFA). But Alex will probably not get as famous
on the Mac as he could be on the ST. I bet most Mac users will take a
look at iCAB, say "interesting browser" and then continue using
IE/Netscape.

Greetings,
Matthias.

> If yes, where can I get it?

There were Unix-like OS available for plan 1040ST back in the 80's.
They are however, not able to run today's software and are very rare.
Minix is not available anymore, but the file system is quite popular on
MiNT. I guess if you expand the memory to 4 MB you would be able to run
a UNIX-like environment with MiNT.

Thank you to all who responded. I have NoSTalgia 0.6 PPC, and PowerST 0.2 both installed and running. I was surprised they ran so slow. May be if I run them out of a RAM disk they will speed up.

It seems to me, about three years ago, I tried an emulator on my PowerPC that actually had a higher bench mark speed then the Mega STe I run at home.

bSTat is a statistical analysis program, written in basic, that produces a nice set of graphical outputs, which then should be printable from the Mac PowerPC. I like using it for both marketing studies and some basic learning theory research that I publish from time to time.

Again, thanks for all of the help. Terry

Hi Matthias,

right, I agree. But a browser that won't load from the net and a mailer
that won't fetch mail isn't much good either to "evaluate".

>
>> Now I'm running in TC here
>> and it won't run in TC.
>
>Then mail it to Jens: jheitmann@debitel.net .

Well, ask Martin Byttebier about this: he met the guy in Neuss, told him
it didn't run in TC on his Hades. The answer was: something wrong in your
setup! Well, probably same stuff with my TT then. Does it work in TC on a
Milan only, perhaps?

>I don't think that ASH, Oxo or Mucs will be giving up their own TCP/IP
>stacks because they are designed to be a reason to buy the software.

In that case they should consider a smaller market for their s/w rather
than making it work on existing stacks.

I bet you're right here too... I am probably going to switch to
Internetting from a Linux machine here soon. Using Netscape or maybe
Linux/Unix specific stuff. Especially the browser will be faster/better
compatible to nowadays standards... and free!

The original hardware only supports two floppy drives.
There was a product several years ago, which added two more, called
the octopus (or similar). It did some more things as well, but the extra
drives was the bit that stood out.

You could probably do some sort of hardware mod that would allow selection of
another floppy drive, but you would need software to support this also.

Hi again Alan,

well, I think for lots from the UK. I had two TV-sets stacked, watched a several hour transmission from the Dutch TV, which also showed live stuff from Cornwall. I think the Druids over there accidentally did a rain dance :-)

Then I switched between Discovery, the Belgian, French and German telly on the 2nd set, so I saw pics from the Herc, from Ostend, from Saarbrucken and later from a place in Romania. 98 percent of the time it was cloudy over here, but I saw the whole thing. Sometimes I even didn't need my "triple-negatives-filter", which worked quite well. Just minutes after the maximum the sky broke open, completely blue :-)

My Australian pennant-rosella didn't know what to make of it. Around the maximum he climbed up to his sleeping stick, after that the sun broke thru' and even now he's still confuzed!

BTW, I had the TT running an astronomy program from 1988, showing the realtime progress of the eclipse. Barely off 15 secs, and my clock is synced to UTC permanently. Who said ST software is useless? :-)

3010. VGA monitor

Newsgroup: comp.sys.atari.st
Date: 1999-08-11 00:00:00 UTC
From: philipt@dial.pipex.com
Message-ID: <7os41n$f93$1@lure.pipex.net>
Source record: 74807

In anticipation of my Atari monochrome monitor giving up the ghost
someday, I'm looking at an old monochrome PC monitor.
It's VGA, I think. It has a D-connector with three rows of pins
populated as follows

```
x o x x o
o o x x o x
x o o o x
```

where o is a pin and x is blank.

Can someone please tell me what these pins are, and how to connect
to the Atari pins/signals?
I have the Atari ST pin-signal list in my Atari manual.

Response by e-mail appreciated, to philipt@dial.pipex.com

What exactly do you mean with this? Are you saying that with Draconis one
will be able to use STiNG/MiNtnet applications or do you mean that with
STiNG or MiNTnet one will be able to use Adamas, DRtelnet etc..

I surely wont give up my MiNTnet setup. Lately I've done a few tests with
Adamas online. I wasn't impressed at all. The first testpage I ran I was
already in big trouble. Adamas returned me something like this. Script-error:
Illegal character found. Yes, it was a java-script page but there is no
reason why Adamas should crash on this page.
The possitive point is that setting up Draconis TCP/IP stack is very easy,
much easier then STiNG for instance.

If the Adamas people want support then they should learn to listen to
people.
At the Neuss fair I have talked to the authors. I've told him that Adamas
won't work in True color on my Hades. Their answer was, It should
work, take a look at your system, probably there is something wrong.
Well, I don't like this kind of attitude at all.
IMHO: People who are reacting like this don't deserve feedback.

>If you find bugs in WenSuite or Light of Adamas
>report them to the programmers! Remember that
>they can be disappointed too if everyone mentions
>only CAB as THE Atari web browser.

The Wensuite people deserve feedback as they listen to what people have to
say. Wensuite is really making progress. They are working on javacript
too. If I may believe the author they are trying to implement MiNTnet
support.
Once Wensuite or Draconis comes with MiNTnet support I will try the
packages again but as long as they only works with there own TCP/IP stack
I refuse to work with it.
For the moment Cab is still the best Atari browser.

It is basically a cartidge based desk accessory, including a clock
function. You need software to use it, and if I recall it was incompatable
with later versions of the operating system. That is all that I know.

It also has a built-in clock, since that was something that was lacking in
the original 520s and 1040s.

> I can tell you that it's possible to hook two harddisks on the
> internal SCSI flatcable !

My TT WoodTTower has :
- 3 hard disks
- 1 Syquest 44
- 1 Pionneer CD ROM
connected to the scsi flat inner cable ... they all work perfectly.
And sometimes I hook up my Microtek E3 scanner to the external scsi port
with absolutely no problem ....
May I add that I have a laser printer SLM605 connected to the ACSI port
?

When it's question of scsi terminators (above all with the TT ...)
you'll have to try and test, but yes you'll surely have to remove the
internal TT terminators when using more than one device connected to the
TT ... More strange is I have to terminate ALL the devices connected
.... I know this is not normal, but it definitely works this way !

Just a suggestion Martin: forget to believe anything coming from them. And absolutely avoid to send any money to this "dream factory" just like you do with people from a northern country .... when they'll go away it will not be momentaneously like the sun today ... just the sun will never take your money away.

Hi all

I've just taken the plunge and bought MagiCPC1.2. I've managed to get STinG working with it when I use an external modem plugged into a com port, but I can't seem to get it to recognise my PC's internal modem. The modem is apparently COM3, but MagiCPC, STinG etc. doesn't recognise that it exists. Anyone got any idea?

Cheers,
Gary

For Sale: Atari Object Mover Software for Kurzweil 1000 series synths.

I have a copy of this software including binder, operating instructions etc.

If you have a Kurzweil 1000 series and an Atari ST then you probably need this. Allows you to handle the 1000 series synths from your computer. Works with Keyboards and modules.

Trades or Offers.

I believe that he has an older 100mHZ PowerPC Mac; according to the
review of NoSTalgia in AC last year it really runs its best under a G3
system. Only MagiCMac is designed to run at blazing speed under as little
as a 680x0 suystem.

BTW, is anyone willing to sell a copy of MagiCMac to me that they're
not using? I just bought a Quadra 950 three weeks ago and I really need to
set this thing up so I can use Edith and a number of other utilities I'm
missing.

Hi Gary,

It works OK with my internal modem, but it worked pretty much from scratch.
Might be worth checking port settings for the PC's COM port, MagiC-PC's
serial port settings and STinG port settings (CPX etc) to see if they all
match (NB MPC only has Modem1, so if you've copied stuff over from a Falcon
you might have settings for a non-existent Modem2, apologies if this is
obvious).

Other than that, you could try checking the modem initialisation string used
by Windows and using that for STinG (assuming the modem works OK from within
Windows) - can't remember off hand how you get at it, but I'd start with
modem properties I guess.

Like JavaScript, implementing CSS will be no small task. Even Netscape
has yet to implement CSS correctly (not that other browsers are perfect).

Just curious what is "TC". I'm running an FX Falcon, and Draconis/Adamas seems more stable at 40 MHz than CAB/STinG, but that 10 limit on the eval pack is a killer as you mentioned.

Neither I nor my stateside dealer, nor Joe at Atari Computing has received any response on obtaining Draconis/Adamas.

```
Hello !

I'm "converting" an assembly source into GFA and I would
like to know how putting a routine in Timer B using GFA ?

Here is a part of the original source :

move.l #timer_b,$120

timer_b:
jsr player+4
bclr #0,$FFFFFA0F

I've tried this in GFA, into a loop :
SLPOKE $120,player%+4
~BCLR($FFFFFFFA0F,0)

but it doesn't work...

Who can help me please ???

(for more info, it's the Sid Sound designer player source)

Thanks !!

Hi,

I guess many of you are too much CAB-centered.
Ok, CAB is a fine browser but there are others as
well. Maybe Oxo will get their browser working
some day and Jens Heitmann has just released a
JavaScript enabled WWW browser. Why doesn't
anybody support them? Both have published many
fresh-ups and updates this year and they deserve
support and feedback!
They still care about the Atari platform and have
ASFAIK no plans to port their software to another
platform.

I can't blame Alexander for moving to the Mac
platform. iCAB has excellent chances to be the
"Opera for Mac" and even if only a few percent of
Mac users buy his browser he will probably earn
more money with iCAB than with CAB.

In my opinion, it is important for the Atari WWW
browsers to keep up with the latest Web
developments. Right now only LoA does this by
implementing JavaScript 1.1 and HTML 4/CSS
support is announced.
If you find bugs in WenSuite or Light of Adamas
report them to the programmers! Remember that
they can be disappointed too if everyone mentions
only CAB as THE Atari web browser.

well, you are right.
However it is clearly obvious to me that if i can not use the browser,
there is no way to do anything here. Just using the old CAB is my only
solution.

I certainly don't want to trade my mintnet for any other stack available
on atari. Might as well change computer in this case. Everything i have is
based around mintnet, OR using gluestik, all the STiK applications.
There are so many things that it would be totally ridiculous (for me at
least) to even try anything else.

I do think though that for some ST users with TOS 1.4 or such, with little
ram or speed, Light of adamas or whatever wensuite might fit better to
their needs.

Adamas sure looks good, dithering is quite good in 16 col, (don't know yet
in 256 or TC mode), possibility to switch palettes, javascript support,
neat I guess (can't try), some many double redraw (need to check that
out). Some clicks are only taken if the frame has been acivated, rather
strange. Few glitches like that, I would put adamas ahead in some ways of
CAB. But really is not too fair to CAB as I know how/when CAB crashes.
WIth adamas, the demo version is so crippled, that can't test a whole lot.

What i've noticed also with ADAMAS, it is less html code error tolerant
than CAB.
Like, a frame not having a <title>blahfoo</title> adamas will freak out
and gives some html code instead of the output.
Same for colors, if you use #white or white only, adamas is very picky.
That is, in a way good, but is not possible in the world we are leaving
in.
html is a very popular language in which ANYONE basically can write in,
mistakes WILL happen, and between netscape and IE, trying to define the
standards, can't rely on anything really. So gotta be as tolerant as
possible. CAB does a pretty good job at that.

> They still care about the Atari platform and
have > ASFAIK no plans to port their software to another
> platform.
which atari platform? that's what i am wondering.
i think we are way too spread right now in some ways. And Adamas with
ANOTHER stack is certainly not helping. What do they expect? All of use
drop our current stack? whatever that is, STIK, STING, MiNTNET, iconnect,
etc etc.
it seems that adamas is not as popular as it should be.
Maybe has to do with the little I said right above.

> In my opinion, it is important for the Atari WWW
> browsers to keep up with the latest Web
> developments. Right now only LoA does this by
> implementing JavaScript 1.1 and HTML 4/CSS
> support is announced.
tell me how good are javascript or html4/css if no one really can use
efficiently adamas?

In my eyes/dreams:

The kick-ass browser for atari would be close to CAB, but supporting
extended VITAL feature a multitasking OS has to offer.
Handling several connections at the same time for multiple download in the
html document, (just like any other browser on other platforms),
decompressing displaying pictures/documents as they get downloaded
(streams/background processing).
Now that is the essence of interactivity.
CAB by itself, visualy is ok/good enough.

What I can tell you is that i always wait after CAB to finish display some
things, formating etc etc.
If it has background processing, and multitple connection, it would be
SOOOOOO FAST.
I mean, screw all the javascript, g2players and all the extra things like
that, if the engine is not good, can't do much.

But of course, this is/was impossible because CAB had to be compatible
with TOS 1.04 (or so), no for multitasking OS user, you can forget about
it.
2) also impossible I guess coz Alex would have had to choose between magic
type of threading or the MiNT way. which needless to say are not 100%
compatible. So I guess, in doubt, he choose the singletos way.

> If you find bugs in WenSuite or Light of Adamas
> report them to the programmers! Remember that
> they can be disappointed too if everyone mentions

AFAIK it is dead - which is a real shame as it seems to be quite a good
emulator, and with many of us deliberateky avoiding Microsoft as a supplier
for our PC OS, it seems like a great time to revive it.

Alas, I know nothing about X programming, and not a lot more about Atari
programming, but if anyone out there is looking for a programming challenge,
I can think of little better to sink your teeth into ;)

Hi Matthias,

I'll try to explain from my point of view (and I'm pretty sure there's
others just like me):

I started Internetting using Sting (yup, I wasn't one of the frontrunners).
As you know Sting evolved from Stik. Then there's another stack, Mintnet,
for which you need to have a complete Mint setup. I happen to have one
here and I am using it mostly for evaluation purposes.

The thing with Sting is that you have a wide variety of clients available.
If you don't like Newsie, use Okami. Or something else. Don't like MyMail?
Get another one. No problem. Whatever.

I've been trying the OXO thing earlier... just a no-go. Apart from that it
needed its own stack. Then LoA sees the lite. Same stuff. I fetched an
early demo. Crippled, works for 10 minutes. Wow, that gives me good
chances to evaluate! OK, give it a try then. Now I'm running in TC here
and it won't run in TC. Hell, is that 1999 software? It may be so that it
keeps up with the latest Web developments, it surely doesn't keep up with
the latest h/w... OK, let's just get back to 8 bit rez then. Yessir, it
works... works? Yes, it loads a page from disk, not from the net. Yes,
Marathon just tells me there's 5 emails waiting. OK fetch them, please. No
go! Won't do it. Well, so much for LoA then, do they really expect me to
pay somuch Deutschmarks for this stuff?
Now suppose I don't like the way the mailer works, I just want another
client. Then install another stack first.

Matthias, with all due respect, this is IMHO NOT the way programmers should proceed. Same bloody stuff with ASH, they come up with Emailer which needs its own stack. Yep, you can use Fiffi then but if you don't like it you need another stack to be able to FTP. By the way, is there any way to go Telnetting, Gophering or IRC-ing with those different stacks???

I'm in the process of giving OXO another chance. Found out that Wensuite is becoming usable (tho' still on its own stack). I'll give that one a try.

As for Alex: well, obviously he decided to go for "The B-I-G money" this time, now people expect me to holler "Hey come back!"... No way! If he'd expected to get rich from the Atariscene, he's had wrong expectations. (Now I surely hope he does get rich from programming for the Mac, but I do have some doubts...)

Hi Dan,

well, ST stands for sixteen/thirtytwo. 16 bit externally, 32 bit
internally. You figure what the TT stands for... :-)

the "e" stands (probably) for enhanced. Enhanced graphics. That's a bit
nice expression, it was still limited to show max 16 colors, but one could
choose from 4096 instead of 16.

The "f" was for the built-in floppy drive, remember that the first models
only had external drives.

The "m" stands for a built-in TV-modulator, so you could hook it up to
your telly.

Fortunately, they stopped using those cryptic descriptions and called
later developments "Falcon" only. The car industry however still uses
descriptions like "Blunder GTX Turbo-4WD 16-v De Luxe Limited" and that's
probably what the folks just want :-)

Dan again!

I'm a bit wildguessing, but I figure it's just that the OS isn't laid out
to serve more than 2 floppydrives... So anything else than A or B is seen
as either a hard drive, RAMdisk or CD-device or whatever. If that isn't
found it just reports "drive not found".

DoubleClick software once had a program to change the steprate for
floppydrives. It is perhaps available on the umich server.

m - inbuilt TV modulator
f- inbuilt floppy disc drive
e - enhanced specifications.

ST - I don't know. Possibly Sam Tramiel.

> Also any link with information on the various 16/32 bt atari systems
> would be helpfull.

Have a look at http://homepage.tinet.ie/~morrikar/ for a history of Atari
and the overall development of the various Atari models
http://www.atari-history.com/ gives brief outlines of all the stuff Atari
made, with specifications and (usually) photos.
http://quickfaq.atari.org is a pretty good start also.
http://homepages.shu.ac.uk/~rgallen/atari/tecspecs.htm briefly outlines the
technical specifications of ST's generally and gives some indication of
model differences.
http://ic.net/~tjh/computers/atari/faqs.html will give a basic outline of
the different versions of the Tos operating system.

>

Hi

That sounds familiar! When I got my MSTE I couldn't reliably format or
use 1.44m disks (under TOS 2.05)! I had to use HD software I used with
my STE's 1.44 drive...

I had no problem formatting and using standard double density (720k)
disks in it. As I use hard drives, I used the floppy drives very little
at the time, so it could have been more serious than inconvenient.

Now I use it under TOS 2.06, I no longer seem to have the problem:)

Hiya

What type of drive is it? (360k, 720k, 1.44m)
What size disks does it use? (3.5", 5.25")
What type of connector does it use? (34-pin Schugart interface, edge
connector etc.)

And there are no free programs there. I recently updated my KCS Omega II to the latest, unreleased version for $39. It has some extra features for the open mode - a kind of programming language to extend the possibilities to use the open mode play screen as an "instrument". Plus there is a very useful MPE-module that imports single sequences or tracks from another file, and an unfinished upgrade to the Song Editor that will let you control transposition etc.in lines in real time via MIDI. This version of the Song Editor looks ugly, and there is no text in the dialog boxes. But it can be useful if for instance you want to change drum sounds in realtime.

Depends on the part of CSS you want to implement. Positioning (layers)
is no easy task IMO but CSS attributes like font-size, font-weight
should work.
At least I hope that CSS will come to the Atari because there are
already three programs supporting it (Texel, HP-Penguin, En Vogue).
Personally, I don't think that we'll see a perfect CSS implementation
this year but Atari users are known for their patience ;-)

TOS version has nothing to do here if I remember well (I had two Mega STE in
the past).
Some Mega STE (if not all) require a PAL to be installed in the dedicated
empty socket to make the use of HD disks completely sure.
But some Mega STE don't have a soldered socket at the required mother board
place.

Hi,

lately I've seen reports about this SETI business, so I got interested.
Just wonder where I can get some basic info about what it is all about,
where to get the s/w and what is expected. If anyone can point me to a URL
for that, tks in advance.

Hi again:

So far on the Falcon I have not found a way to create a single Stereo track
on Logic Audio . Is there a program that will save L & R tracks as wav or AIFF
stereo file? Logic and Cubase seem to be able to save the tracks as two files one for R and
another for L.

Thanks, Raymond

I am developing an Atari GEM desktop type shell for Windows95/98. I just want to know if anyone out there would be interested in such a program or if one already existed.

Let me know your thoughts.

Thanks,

Gareth

Louis, <louis@holleman.demon.nl> wrote on 10.08.1999:

Hi louis,
>Same bloody stuff with ASH, they come up with Emailer which needs its
>own stack. Yep, you can use Fiffi then but if you don't like it you need
>another stack to be able to FTP.

IConnect has received his fair share of criticism, knocking and abuse, IMHO this is very unfair. CAB comes with an OVL file that is not very good, the two OVL files who run under STiNG and are Public Domain perform better. This however has nothing to do with sockets.prg or PPP. People have automaticly assumed, that because CAB performs better running under STiNG/MiNTnet all the other clients are rubbish also.
This is where you are wrong/misinformed:

Fiffi: what is wrong with Fiffi? what can the STiNG ftp clients do that Fiffi can't handle?

Emailer: Another proggie, which has had his fair share of criticism, try it out, You'll never want to return anymore to ANY of the STinG clients, be it for mail or newsgroups

Teli : Wonderfull telnet program, I wonder if there's anything better on the Atari platform?

Chatter: IRC program , just released, I'm not saying this is the best on the Atari platform because I don't know what's available for MiNTNet, but it beats the STiNG clients hands down.

I've mentioned this here before: ICONNECT and STING can be installed at the same time. They do not conflict. So it's possible to run CAB using the STiNG socket and Emailer or whatever using IConnect. The biggest advantage of using the IConnect stack is because the clients in general are very robust, easy to setup, run a bit smoother and all the clients have the same look and feel, which shortens the learning curve a lot. Another advantage is that these programs all interact with each other. Things which can't always be said of the STiNG clients: difficult setup, bugs, not compatible etc..
You don't agree? take a look at the hundreds- no thousands of postings that have been posted from people havings problems here the last year.

OXO: I never succeeded in getting connected to my IP with no matter what version of Wensuite.Trying to load a quite simple html page offline (2 frames, 1 animated GIF) still gives me bombs. So this is definitely a nono.

LOA: The mailer and newsgroups look allright, the main problem is the browser, and that's what this is all about. I don't need another mailer, what I want is a stable browser, like CAB, but one that gives me the advantage of the latest web technology. Instead of concentrating on all the clients, the programmers better would put more efforts in getting the browser right.

>As for Alex: well, obviously he decided to go for "The B-I-G money"

Hi Katherine :-)
>well, you are right.
>However it is clearly obvious to me that if i can not use the browser,
>there is no way to do anything here. Just using the old CAB is my only
>solution.
Oh boy, this surely must be the statement of the year. Especially,
considering it's coming from You :-)))
What happened to the "Let's move on" slogan?

>I certainly don't want to trade my mintnet for any other stack available
>on atari.
No, neither do I want to trade my IConnect clients. Why? same reasons as
you have really, I'm happy with them, they do what they are supposed to
do, are bugfree, compatible with each other and run quite smoothly.
However, this attitude makes me (us) blind and deaf. Not wanting to even
try out the other stacks and compatible clients limits us in our views.
The last year I haven't tried a single STiNG client. Why should I? None
of them offer more then my IConnect clients, so it's just a waste of
time from my point of view. I do realise that with this attitude Wensuite
and Adamas have no chance at all of ever becoming popular. But why change
a perfect working setup for something that is inferior?

>it seems that adamas is not as popular as it should be.
>Maybe has to do with the little I said right above.
Yes it has, and I will add my bit here also:
Adamas, is a suite, I am not interested in another mailer or newsreader,
the one I'm using is perfect. OK, I could use Adamas purely for browsing.
The demo of Adamas hasn't convinced me at all, it's even slower then CAB,
and loading a simple html 3.2 page gives me a very weird display. It also
has trouble with some animated GIF's. These are my first impressions, but
I've seen enough, they are not getting my money !!
This is the demo of a commercial product, it is not a beta version. If
they expect me, the customer to pay money, then I want a working product.
Not something that has been bashed together, shows all the signs of
sloppy work and will only speed up the proces of me getting a nervous
breakdown. I wonder who beta tested this program, has it ever been
tested? Perhaps the customers are the beta testers?
Instead of trying to write a compete suit, the programmers better would
put their efforts in trying to write a decent browser. That on it's own
will already be hard to accomplish...

All of the above applies also to Wensuite, this program has been around
a couple of years now and shows no progress at all. Version 3.xx can now

finally handle frames :-), but it bombs out on some very simple pages. This program is not stable (yet?), but OXO wants payment for it just the same. I call this daylight robbery, we've seen enough of that on the Atari platform. Will they never learn I wonder? What good does it do when the developers are willing to listen, but in practice don't apply the suggestions.

>In my eyes/dreams:
>
>The kick-ass browser for atari would be close to CAB, but supporting
>extended VITAL feature a multitasking OS has to offer.
>Handling several connections at the same time for multiple download in
>the html document, (just like any other browser on other platforms),
>decompressing displaying pictures/documents as they get downloaded
>(streams/background processing). Now that is the essence of
>interactivity.
Katherine, we share almost the same dreams :-)

>I guess coz Alex would have had to choose between magic type of
>threading or the MiNT way.
What do You mean by "choose"? A commercial software writer doesn't have to make that choice. There's only one possibility :-)
Don't forget that CAB was originally developed as an offline browser. When ASH took over many of their programmers have contributed to the program, thanks to these unknown guys , CAB has evolved in what it is now. I think we're all giving Mr.Claus too much credit. It will not be long before the iMac platform comes to realise this also and the big bubble will burst.

Since no one here mentioned ASH, I'll do it:
Love them or hate them, but the fact remains the same. They are the leading publisher on our platform. I don't think that they can afford to have a old outdated/no browser in their program. So maybe, just maybe, they might suprise us (they've done it before) and in october come up with a nice new browser, that looks and handles like the one in your dreams.

Dreams can easily turn into nightmares.... If this browser would be released I bet you anything that it will be an IConnect client only. So then You and a couple of other MiNTNet users will still be stuck. But the big majority of the Atari users will love it, just like they loved CAB. And since it's a ASH product, it will not show signs of sloppy work and will have been beta tested very intensive, before releasing it to the general Public.

Cheers from Belgium
Dennis

PS: A while ago one of the MiNT goeroes, told us here that it would only be a question of weeks before the Netscape browser would be ported over running happily under MinTNet. What happened to that project? troubles in paradise perhaps? :-)

Heya buddy. You can find all the info that's available from the SETI@home web pages at:

http://setiathome.ssl.berkeley.edu

At present, you can't do it on an Atari. :-(

There are programs for PC (Windows, NT, OS/2, etc.), Mac, and various Unix-like OSs such as Linux and BSD as well as various high-end systems like Sun workstations.

At this moment, Team Atari is composed of 23 individuals who have contributed a total of almost thirteen THOUSAND hours of CPU time to the project.

If you've got a PC or a Mac (or even a MIPS or SPARCstation <g>) laying around, you're more than welcome to join us at Team Atari!

Whether or not you join, check out the web page. It's very interesting stuff.

Take care,

Joe Mirando
Founder, Team Atari

>I don't think that ASH, Oxo or Mucs will be giving up their own TCP/IP
>stacks because they are designed to be a reason to buy the software.

But the point is that it's precisely not that; it's a reason to NOT buy the software if you already have a working STinG or MiNTnet setup and are happy with the other programs you use with that stack.

CAB has been so popular because it works with the standard stacks (ie STiK/STinG and MiNTnet). I wouldn't have thought anybody much has bought it to get Iconnect, which for most people is a pointless add-on unless you have a burning desire to use ASH emailer (rare). I would also have thought that there would have been a much higher take-up of both WENsuite and Adamas if they worked with the standard stacks. IMHO these companies are charging up dead-ends at the moment.

I can understand an argument that says they need to program their own stacks in case the freeware authors stop development etc etc, but why the hell they couldn't have made the program interfaces match either STiK/STinG or MiNTnet beats me: then they could have their own stack and other programs would work with it, like winsock under Windows. Just about any Windows net software works with just about any winsock, irrespective of who wrote it. There isn't much that's good about WIndows, but having a standard interface for net programs is one of them.

My own preference for a single standard on the Atari would be STiK/STinG, simply because with the addition of GlueSTiK nearly all the STiK programs will work with MiNTnet too. STinG will work happily with MiNT, vanilla TOS and MagiC, while MiNTnet is limited to MiNT only.

YMMV, but IMHO Draconis, WENsuite and Iconnect are much too limited at present and will stay so until they work with STiK/STinG programs.

>up with a 'unable to access, drive may be damaged' message.

I have had this same symptoms with my HDD. It was caused by a
automatically performed head parking after some time of inactivity.
Start HDUTIL.PRG and check settings of your HDD driver.
Another reason is possible also. Thats what I have found in doc's:

This version allows you to set DMA retries. A few drives
tested have exhibited the peculiarity that if they are
not accessed for a while, the first access receives a
Sense $FE (selection or command phase timeout). Upon an
immediate retry, the drive worked fine. If you have a drive
that gives you a lot of Sense $FE returns, or a drive that
is not always detected, increase the DMA retries by 1.
See the "Config" option of HDUTIL.

The ST only supports 2 floppy drives. Anything else needs to be
either a RAMDISK or Harddrive with proper adaptors.
E-mail if you need more assistance.

Mike

3076. Bombs

Newsgroup: comp.sys.atari.st
Date: 1999-08-12 00:00:00 UTC
From: Mephiston@idirect.com
Message-ID: <37b21bdd.9271322@n3.idirect.com>
Source record: 74829

Could someone tell me what the little bombs that appear on the screen mean.

Sometimes they appear before a crash, and other times when loading stuff.

I assume they are some kind of error message/code but have no idea what.

Thanks,
Dan

3077. Any Mac fans ??

I got 6 extra Mac SE/30's. 2 Work perfect, others have some problems, mainly burn in. No keyboard or mouse.

Looking to make some trades for Atari Equip. Mainly a 1040STF or an External DSDD Drive or DSHD.

E-mail me if interested.

Hi,

I am trying to get a epson floppy to work on the Atari.

It's an EPSON SMD-300, if anyone has any information/jumper settings/schematics on this particular model please let me know.

Also, if anyone has any information on other floppies that can be easily adapted please let me know.

3079. Audio/Video makers lets Unite!

Newsgroup: comp.sys.atari.st
Date: 1999-08-12 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <7otad4$57aa$1@spnode25.nerdc.ufl.edu>
Source record: 74832

Hello friends:

I am a concert guitarist (solo guitar) and use my Falcon for digital recording. I mainly use Logic Audio with which I have made 2 Master CDs. I also work with Cubase Audio.

I would like to exchange ideas with people who use the Falcon for Audio and Video Production.

I have one problem and I hope someone here could help me solve.

I have found a problem in one piece from one of my masters cds. I used Toast on the Mac to extract the audio file as AIF. I imported this file into Logic Audio with no problem at all. When the AIF file was imported into Logic Audio, Logic separated the track into two tracks one for left and one for right.

I am able to edit the tracks as one and the original 44.1 frequency remains untouched. The problem I have is that I need to be able to save this track as a single file stereo AIF file so I that I can load it back into TOAST and burn the audio CD.

So far, when I use DIGITAL MIX to Stereo I still get two files R & L! Also If I or use Digital Mix to MONO Toast does not even see the file that I saved from the Falcon.

I have checked and this files is a 44.1 AIF file and I have played it in the Falcon as AIF 44.1.

Any ideas as how to get the L &R files to be a single STereo file? Also , why does Toast does not see my AIF file at all?

By the way, it is real easy to get the data to the Mac by using Magic Mac which can read and write to my falcon's SCSI drive.

Thanks for your help!

3080. Video/Audio questions?

Newsgroup: comp.sys.atari.st
Date: 1999-08-12 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <7otav4$57aa$2@spnode25.nerdc.ufl.edu>
Source record: 74833

I forgot these questions!

Is there any good shareware or freeware program for the Mac to edit AIF audio files? Also I am looking for an MOV or avi editor for the Mac. I ask this here because I know several people here use both Atari and Macs (I am sure I am not the only one) :)and also because my main work will be done with Apex Media and screen Eye and I would like to make the Films on the Mac if there is a good prg available for it.

Thanks for your help :)

Not quite, ST stands for Sixteen-Thirtytwo. The CPU is 32 bits internaly
but communicates with the rest of the computer via 16 bits only, i.e.,
16 bit bus etc.

The TT being Thirtytwo-Thirtytwo etc...

Later,
Karl.

>
> YMMV, but IMHO Draconis, WENsuite and Iconnect are much too limited at
> present and will stay so until they work with STiK/STinG programs.

Thatï¿½s the point. On my machines, as example, i used STinG (STiK before)
and IConnect (MagiCMac on Mac only) I doasnï¿½t like to install a third, a
fivths stack to get some colorfull pictures out of the web.

Programmers have the chance to make it run with cheap ready to use
stacks. If not, a lot of people doasnï¿½t use/buy it. Easy thing.

Why?
Simple. Before anybody buy another new stack, they used Netscape/FreePPP
on Mac, any PC, Stik/StinG on any Atari. FreeWare. Itï¿½s hard to sell
software that makes the same as freeware.

Hi John,

TC stands for True Color rez, 24 bit, 16 mil colors, whatever. My regular screen mode. I can switch back to 8 bit, 256 colors, but because of all the dithering it's slower. I can run LoA in that mode, but I intend to run it in TC. It won't. Just as it won't run on a Hades in TC. All the makers can say is "it's something wrong in your setup".

Tks very much then... there's more products. Simple as that. Now appearently it seems to work ok on a Milan (I gather that's in TC too). That should be a reason to buy a Milan first, according to their ideology.

Yeah right, that's the way it works: Hey man, I need those specific wheel types on my Blunder GTX blahblah... Well, buy the AlliGator 4WD 16v Turbo Special then, it's got them fitted standard! No sir, those wheels only, please. Nope, they fit the AlliGator only!

Looks like "Howto kill the Atariscene effectively in the shortest possible time..."

Are either of you running in Atari disk mode? That was the only way I could
get the Magic PC demo to run, though I haven't tried Mint yet.

Hi Bob,
>Calling all Atari, Zetnetians: do any of you use IConnect with CAB
>2.5/2.7 and if so can you send me your files for logging on etc.
There's really no need for that....
You have over 95% chance to connect to your ISP, without having to worry about script files.
Just enter your login, pasword and your IP's telephonenumber, modem port and selected nominal speed. Make sure that the ETC path is selected in the "socket" options and save IConf.
Cross your fingers and start IConnect, after something like 15 to 30 seconds a dialogbox should pop up telling you that you're connected...:-)

Yes, that's all there is to it folks. We are talking IConnect here not STinG, right?

Cheers from Belgium
Dennis

Thanks Claes for your detail guide as how to solve the AIFF problem
I have and thanks to all the friends here :)

I will try this method today.

I find Toast a quite good program and I can make the audio cd very
easily. At this point it is the only chice as sound Pool cdr prg
does not support my JVC drive Pinnacle.
There alos a program I found for the Mac called
D-Studiopro and it is quite powerful for editing, I would preffer
to do the editing in Logic Audio falcon.

Logic Audio Falcon has the best sample editor I have seen and it
has all the features (plus more) of Sound Tools including the Time
Digital Machine. I find that Logic is as powerful and as
professional as it could be.

I will get to work and use all the tips from you all :)

Thanks, Raymond

a> I am developing an Atari GEM desktop type shell for Windows95/98. I
just
a> want to know if anyone out there would be interested in such a program
or
Uh, yes YES *YES*! :-))

Although, since I "nailed" the Explorer windows to specific positions, I
can
live with it (especially because I use the Atari mouse cursor and the
"busy
bee"). :->

a> if one already existed.
No, it doesn't. A GEM desktop shell only exist for Windows 3.11 (from the

team of GEM Artline) and is therefore limited i.e. to 8+3 filenames, it
doesn't have DDE and, especially, I would miss these cute little Explorer

enhancements for the right mouse key.

Anyway: A shell like Jiinee would be very nice. :-))

Greetings, Oliver

BUT I don't want to use Iconnect at all. I want to use MiNTnet or STing.
Damned why can't they just adapt their clients to these stacks instead.
For me it looks like they want to force people to use MagiC.

>Fiffi can't handle?

Hi Dennis,

well, I won't discuss the capacities of Iconnect here, I once made a
choice for Sting, then another one to use Mintnet for evaluation
occasionally and that's it. Plenty of clients to play around with, one
better than the other. I admit Sting's a bit like a pig to set up, OTOH
it's not all that difficult. One mite say it has a lot to configure and
sometimes it's just OK that things are widely configurable. BTW, it is
still supported by Ronald Andersson.

I don't know Fiffy. I use aFTP (and have been using Newsie once for FTP).
Well, I like aFTP. Have a choice to d/l complete folders. Have a choice to
drag and drop. Even process files after transferring automatically. The
caching feature suits me fine. Perhaps Fiffy does the same thing, I just
don't know.

About Sting again: I certainly appreciate the fact that I can use 3,4
clients at the same time on the stack. Using Spawner it's just piece a
cake. The whole process runs automated. At the same time I can use the
stack to sync my systemclock.
That possible with Iconnect? If so, it might be interesting for me too.

Another thing: Emailer. It must be hard to get the linewrapping set right,
since 9 out of 10 users at least start with lines of 300, 400 chars long.
How about usenet handling? Does it do both offline and online work? You
know I use Okami, but I still use Newsie for online stuff. How much I like
Okami, there's nothing better than Newsie for online stuff. Ever fetched
binaries from large groups? You know what I'm talking about then.

What concerns my major critisism is the fact that Atari is a very small
platform. Right now we have 5 (yessir, f-i-v-e) different, non-compatible
TCP/IP stacks, all needing their own clients. This is *RIDICULOUS*!
I can justify Sting and Mintnet. Maybe so Iconnect. But Draconis or the

OXO thing? Plain bull. Sorry. Arguments like "that's an argument to buy the software?" They're kidding. Like announcing new s/w for the "Atari" but you need a Milan-060 to be able to run it. I'd say "drop dead"...

PS: the whole thing becomes less interesting to me, since I intend to use the new PC for most Internetting stuff, with Linux that is. No probs with different stacks there. And don't worry, CSAS will be the first group I hook up to :-)

3097. CAF Mixers Not Working

Newsgroup: comp.sys.atari.st
Date: 1999-08-13 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7p1rsn$1v2h@enews4.newsguy.com>
Source record: 74650

This is a new one for me...

I've been using CAF (version 2.06) for quite a while now, but I haven't done any AUDIO recording for a while - at least not since I had the Nemesis installed in my Falcon. Anyway, I was messing around with some guitar/vocal tracks I had recorded a few months ago last night, and for some reason unknown to me, none of the audio mixers do ANYTHING at all!

They've always worked fine before, but not any more. And yes, I've got the correct one chosen in the hardware setup screen, the mixer track is unmuted, and when I double click on it, it brings up the mixer screen (in this example, GRAPHIC EQ). But any changes made to the volume faders or EQ does nothing to the sound. The same thing happens with all of them.

I can only assume that this problem is somehow caused by the Nemesis - perhaps some small error in the installation? But I also had this same problem when I did a clean boot, with Nemesis OFF. And I tried running a couple previous versions of CAF, as well as running from a backup - all with the same results. My mixers just no longer work, period.

Everything else seems to work fine with regard to recording and playback though, and my recently aquired FDI seems to function properly as well (and yes I tested with and without the FDI attached). So is it possible that the portion of the DSP that deals with the effects in CAF has gone bad while the rest is ok? Or have I had some sort of mental lapse and forgotten some setting in CAF?

Any help would be appreciated.

-Paul

Double click on one of the mixer items.. in the lower right hand corner, if it says something other then "dsp," that's the problem. Go back out, select all events in the mixer map, shift-double click on one, change it, then hold alt and click OK.. it will then ask if you want to apply the change to all selected. Click OK, and you're set!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

For Atari Sales and Service from someone with nearly 20 years of Atari experience go to my Web site below or E-Mail me at atari@benjamin.net where you can find for the Atari 8 Bit coveted Happy Drives and other Disk Drives modified for increased performance and speed. As well as a library of Reference Materials from COMPUTE! Books. You can find NEW Atari ST software Marked down in Price, Disk Drives made by Indus for the Atari ST and Reference Books Published by ABACUS and I've added and will be adding more Hardware, Software, Books & Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. And remember if you dont come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. We meet the 2nd Tuesday of each Month. Our Next meeting will be Tuesday, September 14th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop & Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President
Ben Smith at (503)256-9974 See you there!

Martin Nightowl Byttebier a *crit :

> BUT I don't want to use Iconnect at all. I want to use MiNTnet or STing.
> Damned why can't they just adapt their clients to these stacks instead.

I suppose the authors also are free to do exactly what they want.

> For me it looks like they want to force people to use MagiC.

So, so ... I can feel you are forced to use MiNTnet or STing :)... Why
?... don't you feel
free Martin ?
NOBODY forces you to do anything ... even paying taxes is not obliged ...
You can go away from Belgium and in the same time avoid to eat dioxined meat.

Pushing this argument further I don't want to receive electricity,
water, gas
and phone line home ...
I want to go back to the Middle Age because the problems were not so superficial
you know ...
You don't like the way I fight ... die now jester.

Living is definitely not computing ... shame on me I'm continuing to use
computers ... ! Jo the paradoxical is here again !

Is there any chance somebody here do like to use easy, obvious things ?
Not using programs for configuring them but ONLY use them ...

Atari users are they so intelligent to spend so much time on
configuration files
?

In this case I definitely am not ! Oh yes definitely !

:) .... :/ .....:(

I definitely did like to use and fight with Atari machines because a few
years ago it was yet possible to find this way a nice "middle way" ...
today being an atarist/rian has become a lot more difficult ...
availability, support, quality, esoteric machines ....

So the middle way is definitely nomore here ... you and I are
antiquaries and so are our older antic computers ... someone may find
funny to continue to use them if they persist to only use one or two
existing programs and if they avoid multimedia culture support ... but
the others cannot continue only with atari computers. The fact is:
A lot of comp.sys.atari.st participants do use other computers together
(like me since a few months ago) ...

So, desesperately crying because left authors don't adapt their programs to our own taste is like "urinate in a violin" and I rather prefer to say "urinate in a double bass"*
This is also not a reason to now incense programs which were considered like hell just a few months ago ! ... I feel this direction more and more among you. Just because unavailability has become habitude is not sufficient to cross to the previously unreachable mediocrity.

Strangely ... as far we go we must admit that atari authors/users set them apart from the other left part especially while speaking about "internet" utilities ... this seems to be the favorite fight place ever encountered :)

There is no way to find such a movement when talking about graphics usage and/or text-pao usage ...

But, of course I continue to like more than ever all these discussions because I was so involved with them in the nearest past ...
Believe me or not macintosh news groups are definitely not so interesting (and I have tried some of them during the latest months ...)
The most constructive news group is here.

Jo

But can you really blame Alex for his shift to Mac based iCab? There is a far more lucrative and potentially exciting business to open up for the iCab company with Mac than there is with Atari users. We (myself included) Atari users have proven to Alex that Atari versions of Cab are not going to be financial bread-winners, due to our 'hobbyist' nature and messy efforts to provide stable connections.

The connection problems I think have been the primary reason why Cab has not gone ahead as iCab can use Mac Runtime for Java etc to do things that no-one with Atari net software can do competently right now. If the Atari platform and its OS's had OS level stacks the whole freakin' mess would be in a better situation, instead of the bits and pieces that collectively make up the TCP/IP stacks that exist today! All protocol should run through the OS similar to how MacOS does things. That way control can be kept on how apps 'talk' to the stack programs!! Common sense it is!!! I have never seen MacTCP crash, Netscape maybe but that another story...the stack is bulletproof!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi Gareth:

Humm that sounds interesting. When I HAVE to USE Windows I
really dislike the Win desktop as it really is a pain to use.
A GEM like (Atari like) desktop with all the functions would
really make things easier but I am afraid Win95/98 would be
always a pain no matter what dress we put on it : (

I also use the Mac and I am convinced that the Atari Desktop
(and is functions) is really the best :)

The actual time taken is CPU time so no matter if it is a screen saver or always run, the cpu time will be the same.

I run 1.05 on W98 and the NT command line at work. I have been testing to see whether the NT command line is quicker than the graphical version (should be). The NT command line version works on W98 as well, I maximise the DOS window to give it exclusive CPU access.

I have noticed that not all blocks take the same time so it is difficult to benchmarch the two versions against each other.

Mark

Calling all Atari, Zetnetians: do any of you use IConnect with CAB 2.5/2.7 and if so can you send me your files for logging on etc. I use Sting and NEWSIE etc like most, but want to investigate Fiffi etc. The manual assumes you know the log on system with the ISP involved. I have tried to determine it from the dial.scr and default.cfg of Sting, but no luck. Any help please.

This is very true...I have been following this thread with alot of
interest and have followed the suggestion of installing ICONNECT and
STING together.I have been testing ICONNECT on the only client I
have,CAB,and find the CAB...flame me if you must...runs better and
faster than it does under STING.I have not tried any other ICONNECT
client but after my results with CAB I think this is probably the
better stack to follow.....Are there any Demo versions of ICONNECT
clients to try out?

The only good thing I have found with Adamas is that it is quite easy
to set up as this is all done in the install process.As far as the
browser is concerned:I found that it crashed much to often and was
very,very slow.I am suprised they even thought about releasing a
product with so many bugs.Some Beta versions of programs work better
than this commercial offering....Well,they wont get my money.

In one way it's a good thing the web has been slow to adopt CSS (although
that's changing). I've heard that even MIE 5.0 doesn't fully support
CSS1. And to think the consortium is already working on CSS3 :-^

As an aside, Atari browsers are languishing in obscurity. The link below
is an attempt to list every browser out there, yet fails to list any for
the Atari (be warned the document is 249K):

Can I add my penny worth (old money) of praise for CAB. The latest version 2.7 (ï¿½10 update from SS) gives you a more stable, slightly faster browser, the freeze ups etc on my set-up being from my use of virtual memory rather than the program. The way that the modules seamlessly work with CAB is a joy, especially JOE giving you a very good HTML authoring outfit, GEMTRADE, giving you a unique ability to translate German on the fly and AUTOSURF, giving you the ability to (once you've discovered the image/pix/etc directory) download megabytes of images in minutes and entire web pages for off -line viewing. The egocentric inclusion of special drop down menus to just access ASH's web page is not really annoying, just pointless.

The latest Wensuite demo seems very fast and the in-program FTP, NEWS programs seem useful, but until I hear better reports of OXO's UK awareness, I'll keep my money.

Taking the advice of Dennis Vermeire, (cuddling up to an ST on a beach somewhere!!), I want to investigate the rest of the ASH/CAB suite, having paid for it!!

Bob King.

Can anyone advise how I can transfer a file written in the free database
"DB Master" software that I got with my ST in round 1988, into a Mac or
PC database-readable format.
I'ld be very grateful for any practical advice - particularly addresses
of companies that could do it for me from an Atari diskette.
Many thanks,
Andrew Cookson

I think that the SoundPool software may just be what you're after. They
have a program called AudioMaster (currently 2.05), which will perform
the tasks you're after.
For a demoversion http://www.soundpool.de ,take a look at the FAQ also
while you're there.

> Any ideas as how to get the L &R files to be a single STereo
> file? Also , why does Toast does not see my AIF file at all?
Mac users, will not like the following:
Contrary to popular belief, Toast is not very well suited for producing
Audio CD's. On the Atari platform we have a program that will make most
of the Audio CD creating software on other platforms blush and walk away.
At the same website look for CD AUDIO PRO, there's a demo available and
since you already have a CD Burner, you can try burning a Redbook CD-DA
immidiately.

>I mainly use Logic Audio with which I have made 2 Master CDs. I also
>work with Cubase Audio.
If this sounds like a commercial, sorry :-) Again take a look at
SoundPool's page and download WaveMaster and AudioTracker, these programs
can work as stand alone programs, but can also be combined to work with
Cubase Audio and Logic. Editing your samples will never be the same
again.

AudioMaster and CD Audio Pro work together perfectly, this combo might be
reason that you delete Toast.... :-)and I hate to think what you're going
to do with Logic Audio.

For more info contact me via PM

Cheers from Belgium
Dennis

3119. Re: Shard of Spring for ST

I'm not sure if it's the sequel to Wizards Crown. I do know that Demons Winter is the sequel to the Shard of Spring and Demons Winter did come out for the ST. I searched Little Green Desktop and found DW but not Shard of Spring. I would sure love to find it. I played DW on the IBM-pc and it looks a whole lot different than the ST version. I would imagine Shard of Spring would look a lot better, too.

Hi,
You can always find the latest version of all SoundPool programs for
free download at www.soundpool.de - that is, if you already own the
original with the cartridge protection key...

two files one for R and another for L.
>
> Thanks, Raymond

Hi Raymond,
I've never used Logic, but I'm quite familiar with most functions in Cubase Audio, so I'll explain how to do it in CAF.
If you have two mono files you want to join into one stereo file, just use the Mix setting as input device in the Hardware setup menu. The left and right tracks must be set to other tracks than 1 and 2.
See to it that the left and right tracks are aligned without any glitches. Then you enter the mixer you're using and set the faders to maximum (otherwise you'll have to Normalize afterwards - and thereby get som more noise) - and set the Panpots to the extreme left and right to get the correct stereo image.
Choose a new track and use the ANY setting to enable stereo recording. Set the left and right locators at the beginning and end of the music and mark the Out box to make the recording stop at the end of the music (listen carefully so you don't cut the end). Now just hit the record button and name the new track, just like a normal recording. The result is a stereo mix of the mono tracks. BTW - why did you split the stereo file in the first place? ;)
In the manual, this is called "permanent mixdown" and it's very poorly described, but this way you can record a number of tracks and then make a mixdown to a stereo track. When you set the Input device to Mix instead of FDI, Analog or ADAT, you tell CAF to record whatever is played back on the other audio tracks - using the settings in the active mixer. Recording of stereo tracks is only possible on track 1+2, so those tracks can't be in use.
I hope this explanation helps you out with your problem.

I'll continue a bit about this mixdown thing, since it has great possibilities that many people aren't aware of.
Playback of up to 4 stereo tracks (or playback of 3 stereo tracks while recording them on the "Any" track) is possible with a small trick; Import the files in the Pool and then drag the first one to the "Any" track. Then you just go to the arrange window and drag the track to one of the mono tracks and it will still play in stereo - I've only used

even pairs 3+4, 5+6 and 7+8 and of course the "real" stereo track, called "Any" which uses 1+2, but I suppose any combination will work - move the stereo track to track 3 and it will use 3+4; to track 5 and it'll use 5+6 etc... The faders can be stereo linked in the mixermap if you prefer and you must set the Panpot to the extreme left/right for those tracks if you want to keep the same stereo image as the original stereo file. Of course, you can also set the faders and panning to other preferences if you're using this function to make a wide choir which should be present all over the stereo image instead of at the left and right... This way, you can actually build up a great Gospel choir on your own :) However, if you use the audio editor on one of those "fake" stereo tracks, you'll only be able to view the waveform of the left channel - but everything actually works beautifully.

Still another use for the "Permanent mixdown" function is to cut out unwanted audio. Very often it can be a faster way than to use the "Delete unused" function in the Pool... Then you won't have to worry for old takes that are behind the most current take and therefore aren't visible in the audio editor, but still use space, both on harddisk and in RAM. Just record the track on another track after editing and you'll have a new, clean track only containing exactly what you want :) Then it will be safe to delete the original track in the arrange-window and delete permanently by using <shift><backspace> in the Pool for those unwanted recordings. Never forget to set the fader in the mixer to it's maximum position when you do like this - or you'll loose dynamics and gain noise - not the most desirable things... ;)

Best regards,
Claes

Flame You? why? because you're stating the facts.
I've been saying, writing, telling and even shouting this for months, but
the majority is so anti ASH minded here, that they choose to ignore it.

CAB runs much more stable and up to 25% faster with IConnect, these are
facts, sorry guys, I can't change these. Running the ftp client Fiffi
shows the difference in speed even better, and yes it also 25% faster :-)

>I have not tried any other ICONNECT client but after my results with CAB
>I think this is probably the better stack to follow....
It is, and what's more. ASH keeps improving it, the most recent version
is as stable as a rock. IConnect is still being improved and updated,
something that can't be said of S***G, CAB.OVL has also been improved a
lot and is now at the same level as the two alternative OVL files. When a
new version arrives it might well take the lead.

>Are there any Demo versions of ICONNECT clients to try out?
Fiffi - ftp client ,included with CAB 2.7
Teli - telnet client, shareware
Emailer - mailer and newsgroup, commercial
Chatter - IRC, commercial

You can download Teli from http://www.camelot.de/~zulu
a demo version from Chatter can be found at http://bengy.atari.org
English RSC files for Fiffi, Teli, IConnect and Emailer can also be
downloaded from this site.

>Thats true....What would the Atari platform be without ASH?
To keep the peace I'll let someone else answer this :-)

Cheers from Belgium
Dennis

3124. Connecting TT to Pc using nullmodemcable

Newsgroup: comp.sys.atari.st

Hi,

Is there a way to connect my TT and my pc with a nullmodemcable using
Sting ?
I want to let my pc getting all mail and news and let the tt connect to
the pc to collect mail and news from the pc.

I can't get it to work....

While you are up in this part of the world , don;t forget the
beautifull daintree rainforest to the north.

There are two sort of backpacker places to stay Crocodylis which is a
YHA type place , has lot's of activities but not much to do at night ,
whereas P.K's a bit further up the road is a bit more of a party
place.

Deals from Cairns can be picked up cheap , especially if you shop
around. They include transport , an interesting guide , and a couple
of nights at either resort. Which can be extended.

If you want paradise then this isn't a bad place to start.

cheers for now.

Paul Mac

Careful now. It might be correct in your case, but I definitely know about atleast two very pissed off IConnect-users (actually, I only know two IConnect users...).

> CAB runs much more stable and up to 25% faster with IConnect, these are
> facts, sorry guys, I can't change these. Running the ftp client Fiffi

Sorry Dennis, this "fact" is very easy to change, I can easily make IConnect 90% slower than STiNG if I want... It's basically just a matter of configurations and ISPs. With some ISPs IConnect works best, and with some it doesn't work at all. The same applies to STiNG.

Until you've tested IConnect, STiNG, Adamas, WenSuite and MiNTnet on several different ISPs, with several different machines, different clients etc. it's just plain stupid to claim any "facts" at all.

> something that can't be said of S***G, CAB.OVL has also been improved a

Excuse me? STiNG was recently updated AFAIK. MiNTnet has been updated several times the last few months. IConnect is also a pure dialup-stack, hence unusable in a LAN.

>>Thats true....What would the Atari platform be without ASH?
> To keep the peace I'll let someone else answer this :-)

It would be pretty much the same as today. We're too stupid not to fight, not even the few QL-users that's still around manages to agree upon one OS...

Dennis Vermeire <ols05426@online.be> wrote:

> Fiffi: what is wrong with Fiffi? what can the STiNG ftp clients do that
> Fiffi can't handle?

I think you missed the point - IConnect only works under MagiC, so even if these clients are as wonderful as you claim, you're forced to buy MagiC to use them. What if you want to use EMailer, but also like to use memory-protection and Paral when you program? Dual-boot?

> Emailer: Another proggie, which has had his fair share of criticism, try
> it out, You'll never want to return anymore to ANY of the STinG clients,
> be it for mail or newsgroups

Emailer sucks. Period. It recently got some *extremely* useful features (like background images and *true* smilies), but aMail is still the choice if you want functionality. As for news I can only say that *any* offline reader sucks, regardless of platform. Running local news-clients over a modem is a pain, the absolutely best and fastest way to read news is to telnet to a fast box with a fast connection and use tin, knews or something similar. They're not pretty, but very fast and very functional.

> Teli : Wonderfull telnet program, I wonder if there's anything better on
> the Atari platform?

Cough... Teli works, but that's all. The good old BSD-telnet is still a lot better. The telnet-clients for STiNG are not good though, most of them have serious shortcomings in their terminal-emulators.

> I've mentioned this here before: ICONNECT and STING can be installed at
> the same time. They do not conflict. So it's possible to run CAB using

Try being online with both at the same time... I would think that anyone who starts with such a dual-setup will end up using just one of them after a while.

> are very robust, easy to setup, run a bit smoother and all the clients

Geir Vi¿½lidalo, are you listening? I told you so, it's not the software, it's just you. You're obviously a complete idiot since you can't even get Emailer to work, while I'm probably the genious here, since I don't have any problems with my MiNT-Net and STiNG-clients.

> Things which can't always be said of the STiNG clients: difficult setup,

I agree. Desktops like Thing and Jinnee are a *lot* better than any desktop for the mainstream-platforms. But both KDE and GNOME (Linux) is catching on, and probably the best desktop I've ever seen is Directory Opus on the Amiga. I sure hope that "our" desktop-developers steals some ideas from these :-)

>compatible TCP/IP stacks, all needing their own clients. This is
>*RIDICULOUS*!
I share your concerns, it is ridiculous and there's always a chance that number six is in development right now :-). However, it's a burden we'll have to carry, there's no Atari anymore to set out guidelines. And the developers on our platform will never agree to a mutual standard, because they all feel they have the best stack.

>I can justify Sting and Mintnet. Maybe so Iconnect. But Draconis or the
>OXO thing? Plain bull. Sorry. Arguments like "that's an argument to buy
>the software?" They're kidding. Like announcing new s/w for the "Atari"
>but you need a Milan-060 to be able to run it. I'd say "drop dead"...
Justifying STiNG goes without saying, and what in heavens name can one say about MiNTNet, people like Martin, Katherine and Jo-Even are not exactly dumb, blind and deaf, so I gues MiNTNet has a reason to exist also..

There needs to be a commercial stack, development of the two free stacks goes painstakingly slow and let's face it, there haven't been exactly exiting updates or improvements lately.
We tend to forget sometimes that we are more or less the top of the mountain here on USEnet. There is a vast majority who has never heard of STiNG let alone MiNTNet, and if you talk about TCP/IP will think that this is some kind of new car. These people are best served with IConnect, I'm not going to repeat IConnects virtues here again, let's just say it has a simple setup.

Wensuite and LOA are no match, simply because none of them is stable. The last thing one wants to install is an unstable TCP/IP stack. My personal views are that Wensuite is not going to make it/survive because of the incompetence of Oxo Systems (the softwarehouse, NOT the programmers). I have mixed feelings about LOA, since this program will be installed on the new Milan 500, it might just become the new standard. I-fusion which is now in beta stage will probably fix the stack problem. This program will allow LOA and STiNG clients to run under the IConnect stack. Since MagiC will be the OS on the new Milan, this thing might sort itself out. I think that IConnect will be installed as the stack, with LOA running as client, the clients that are missing like IRC, gopher, telnet etc.. are already available as STiNG and IConnect clients. That's the nice thing about commercial software,

the market tends to sort itself out.

Supposing this scenario would be followed, MiNTNet users will still be stuck, and even if LOA sorts the html 4.0 and JavaScript problems out, it still is a slow browser. And one needs to run MagiC also :-))

>the whole thing becomes less interesting to me, since I intend to use
>the new PC for most Internetting stuff, with Linux that is. No probs
>with different stacks there. And don't worry, CSAS will be the first
>group I hook up to :-)
Sadly, I admit that this is the "third" way. If one wants speedy access, and no nervous breakdowns then a Mac or PC will fill the gap. Once that more people have access to a cablemodem and an Ethernet connection becomes necessary then the other platforms are the only option. The rare to find Riebl Card is not good enough, and the MiNTNet installation will put most people off. I know that an Ethernet Card can be installed in the Milan and the Hades, but the software (MiNTNet) is not up to todays standards, some people might not share this view but it is a sad fact. One needs to know a lot about MinT to get MinTNet running.... What's that rumble I'm hearing in the distance? Oh, nothing special, hell just broke loose. :-)

Cheers from Belgium
Dennis

>Ronald Andersson.
STiNG might be a problem for the unexperienced user, however I know a couple of programs which makes STiNG looks like a piece of cake. A TCP/IP stack needs to be higly configurable, STiNG and IConnect both are. IConnect takes a different approach, but a lot more options, flags and variables can be set then in STiNG, just activate the PRO option and you will see what I mean. When one has a IP that keeps to the general norms, IConnect can be installed in less then five minutes.
I know that STiNG is still supported, but there is a difference between suporting and improving/updating a program.

??? sorry Louis, I can't help You here. I don't really understand what you mean ??

>Another thing: Emailer. It must be hard to get the linewrapping set
>right, since 9 out of 10 users at least start with lines of 300, 400
>chars long.
This is a misconception, it's not Emailer who's at fault here, but the various mailingprograms that lack this vital function. When you switch to the PC and Linux, you'll soon find out this is dead normal.
However, since version 2.0 an option has been build in to set the linelenght. When I write a mail to someone on a PC or Mac, I don't have to care about linewrapping, when I write a mail or posting to an Atari user I

set the linelenght. In fact I don't have to set anything anymore come to think of it. I just open the text editor window and set that window to the size I like, when the text reaches the border it will wrap itself to the next line. I'm writing like this at the moment.

>How about usenet handling? Does it do both offline and online work? You
>know I use Okami, but I still use Newsie for online stuff. How much I
>like Okami, there's nothing better than Newsie for online stuff. Ever
>fetched binaries from large groups? You know what I'm talking about then.
Haha, here comes the dreaded question....
No, Emailer can't read the headings of the postings online. Since I don't need to fetch binaries I never missed that option. But I agree that this should be implemented just as well (in fact a little bird told me that the soon to be released version 2.1 will have this implemented).

Okami is no option at all, this program is written by someone sitting high on a mountain looking down at the world. By the time one has setup the program his hair starts to turn grey. If it would offer any advantages I possibly might accept this, but there are none. In fact let me tell you that ASH Emailer has more functions and options then Okami. Yes, You guessed right, I'm not exactly a fan of Okami. It has been on top a long time not because it was that good, but simply because there was no competition. Now, it's an example of how programs should definitely NOT be written on our platform.

>I once made a choice for Sting, then another one to use Mintnet for
>evaluation occasionally and that's it.
The nice thing is that we're able to choose. What was getting on my nerves was the constant IConnect bashing here in this newsgroups. Most people probably have never tried it out, and are unaware of the clients. How on earth can one possibly comment on a program if he never used it?
It's like the discussion in the Dutch Mailinglist a couple of weeks ago where someone declared that Papyrus was "the best wordprocessor on our and other platforms". Statements like this make me climb on that famous white horse. As long as one hasn't tried out the competition or at least knows what it might be capable off he/she should keep his/her mouth shut.

Louis, if you really want to try out IConnect and his clients, just drop me a PM and I'll put you on the right track... but to be honest, the minute you'll have that PC, you'll forget STiNG, MiNTNet, IConnect etc... and probably be glad you're not stucked with them anymore.

Cheers from Belgium
Dennis

3132. How to clean yellowing plastic casing

Newsgroup: comp.sys.atari.st

I know this question has come up before, but I don't recall seeing a final verdict. Just wondering if anyone had some thoughts on how (or if) game units with yellowing plastic should be cleaned, and if some of the yellowing can be removed. I am mainly thinking about some older Atari computer equipment, however I am not sure if the yellowing is due to old age, a smoke filled environment or a little bit of both.

Any thoughts are welcomed. You can post to the group or email me at classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Thanks in advance.

This really shouldn't be much of a concern anymore, now that I-Fusion, which I've been betatesting for months now with no problem, is completed (or atleast very very near completion, Im not exactly sure) Even though I must admit, Even now that I can, I rarely run Stik clients when I'm online; The Iconnect clients do Everything I need, I especially like how fiffi is Scriptable with ASH Scripter, Especially when managing a large webpage which is updated frequently.. it makes life quite a bit easier.

Anyways, Ifusion Homepage:

Hi Mauro,

It's been a long time since I was there ('90-'91), and I can't remember the lounge/bar/pub names... Cairns is really pretty small, so it shouldn't take much time to see most things by foot. Ask the locals - they're friendly! :-) I CAN recommend seeing the Great Barrier Reef. Take the boat "Noah's Ark". I talked to someone recently who said they were still in business. Do the "resort dive" (scuba), then go out to the reef and snorkle or scuba some more with them. It's WAY cool!!!. The Daintree Rainforest is also a must see. I took a small plane up there (flew out over the reefs - Wow), and then a small bus came back thru Port Douglas, etc. I can recommend "Tracks" hostel in Cairns. Have fun - I did. ;-)

Say.... what does Cairns have to do with Atari?????? Are you trying to lead me off-topic or something?

Bye,

Clayton Murray

3138. Akai S700 info please

Newsgroup: comp.sys.atari.st
Date: 1999-08-14 00:00:00 UTC
From: sonik@zetnet.co.uk
Message-ID: <37b53816$0$158@news.zetnet.co.uk>
Source record: 74671

Greetings fellow Atarians

As a practising ST-based muso, I've recently been considering buying a second-hand Akai S700 sampler I've seen. As I've not much experience of working with samplers (but otherwise am well used to music tech), I'd appreciate some tips from any owners on the NG.

Don't ask why I'm not looking for something a bit more current - I like bits that the music world has forgotten! The S700 also has a special interface with an Akai VX90 analogue synth module which I also have, and as it's going relatively cheaply, I'm effectively killing three birds with the same stone.

I'm also looking for samples and would like to know whether there are currently any system upgrades around for it or samples on the Net. If you are the owner of an Akai sampler, particularly an S700 or X7000, maybe you could give me some advice?

I know the S700 takes Quikdisks - does anyone know of anywhere that still supplies these? I gather there may be one in the back pages of Sound On Sound magazine.

Thanks for any help. Sorry for so many questions! Please mail me if you have any info.

Cheers

Al

Hi again Dennis,

well if you read the Mint-list, I thought hell broke loose last week :-)

It's exactly that which prevents me from constantly updating my Mint
setup, one would need a separate admin to do the job, and it would be a
nearly 24 hrs/day job... Then Uwe joined in the german Mint/MTOS group, oh
boy! Sometimes I wonder: Will Linux be different??? :-)) Right now I only
hooked up to Linux.m68k, but that will probably be more groups once I have
this stuff up 'n running.

Someone wrote a small client to use on the stack, which upon connecting
fetches the time from a timeserver and syncs the internal systemclock.
Simple as that. I use UTC on my system, thus I don't need resetting to
winter/summertime. Even that can be done automated. It happens while other
clients fetch/send mail or news. Perhaps such a client exists for use on
other stacks as well, just dunno... For me it's just important to have the
EXACT time on my system, since I run some astronomy s/w that uses the
systemclock. The last eclipse was a nice example. I could watch it
realtime on the TT here :-)

Well, I just don't know, but am begging to differ: I receive news from lotsa users: Mac people, PC/Win users, Linuxers, Unixers, Atarians, Amigafreaks, whatever. The ONLY ones where my readers have problems are people using MS Wizard s/w and ASH Emailers... Now I seem to recall that this whole usenet bunch started on Unix machines. I just checked again a few messages written with TIN, Pine, whatever: no probs at all. I know MyMail does automated wrapping too, but several apps don't do that and in fact it should not be necessary to set it in a reader. It should originate in the right form from the sender. It's just that MS software and Emailer don't comply because they both have no probs with it simply because the reader wraps automatically.

>>How about usenet handling? Does it do both offline and online work? You

>competition. Now, it's an example of how programs should definitely NOT be
>written on our platform.

Let's just agree to disagree here: IMO Okami stems from the old Unix standard and complies with it. I agree one needs some time and effort to get it running but once running I just love it. Ever configured Pine? Then Okami's just nothing to set up :-) I admit these are not the kinda programs for the folks "How to hookup and start hoppin' onto the Net in 30 seconds"...

>Louis, if you really want to try out IConnect and his clients, just drop

This is true for most software. Graphics, sound, midi, games,
internet-stuff... The PC and Mac has superior software in all these areas,
so why do we use our Ataris?

> more people have access to a cablemodem and an Ethernet connection
> becomes necessary then the other platforms are the only option. The rare

And what about STiNG?

> the Milan and the Hades, but the software (MiNTNet) is not up to todays
> standards, some people might not share this view but it is a sad fact. One

Hehe... It's rather sad to se an otherwise intelligent person write such
crap... You obviously have no idea what MiNT-net really is. MiNT-Net is
harder to set up for some people, because it doesn't have wizards and
GEM-frontends, but it's also incredibly powerful compared to the other
stacks around. Basically MiNT-Net provides *real* networking, while the
other stacks (OK, not STiNG, but STiNG has other weaknesses) are
basically simple point-to-point stacks that can only be used for a single
dial-up connection.

The entire internet is built around the same "outdated" standards and
implementations you find in MiNT-Net...

Bulls**t. It's just a matter of...

a) What you're used to.
b) What you like.

If you're used to the unix-way of setting up stuff, you'll probably find
flashy GUIs hard to use as well. NT is a good example of how horrible a
GUI can be to do such tasks.

> boy! Sometimes I wonder: Will Linux be different??? :-)) Right now I only

Linux, is much, much worse. If you stick to one distribution and don't
start hacking around it's OK, but the Linux-community is so fragmented
that you're guaranteed to run into heaps of problems if you start hacking.

May I ask why you're still using your TT? And why you spent a lot of
effort getting your Atari-gear working again?

I have had two Windows-PCs the last four years, I sold both after just a
few months. I really don't know why I bought them, I think I just got a
feeling that I had to "keep up" with the rest of the world. Well, the PCs
sucked, although the last one I had was a rather expensive and fast beast.
Sure, they were fast and had lots of software, but after a little while I
spent less and less time with them and more with my trusty Falcon.

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://uvk.atari.org.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

3146. Re: How to clean yellowing plastic casing

Newsgroup: comp.sys.atari.st
Date: 1999-08-14 00:00:00 UTC
From: Brian Fowler <bdsfowler@home.com>

Source record: 74679
Cross-posted to: alt.games.video.classic,comp.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.classic

I have had success in removing yellow stains by soaking the plastic
object in bleach.
I removed all the labels, and metal parts first, but it worked fairly
well. If you can't isolate the part to plastic only, you can try laying
a napkin soaked in bleach on the offending plastic part, making sure the
bleach does not go places you don't want it to. It can take a day or
more for each soaking, and I would advise against performing this in
certain places, like the kitchen counter or dining room table!

Hope this helps!
Brian

one product that I know works is a special version of Easy-Off that was
designed for use with microwave ovens, my brother actually demonstrated to
me how well it worked by spraying it on a Mac Plus and I saw its yellowed
case return to its original putty colour. Problem is, I haven't seen it
available in Canada for some time.

Old age doesn't do it. There are three things that can do it. Smoke.
Heat (probably not the culprit). Sunlight or ultrviolet (over time).
The smoke one is easy. That's tar film. Comes off pretty easy with a
solvent (such as fantastic or whatever cleaner). The other two I'm
afraid there's no real good cure for other than to mil off plastic
until you get past the yellowed plastic. That's really not an option.

Forget that. CAB works also realy fast ans stable with STinG.
IConnect isnï¿½t the latest word in socket technical..
If you have different results in the form of 25%, anythig of your STinG
installation is wrong.

Mostly i got more cps with STinG on the same site.

And the main point: CAB works realy fine with STinG on any single TOS
system. Most clients for STinG are free. IConnect too?
You got a free client for Iconect?
Isnï¿½t bad, isnï¿½t a problem, but you have to pay for any smal pubs..

Have a look for english releases, you got it 5 month (ore more??) after
a new german release. Authors can build also english .rsc files, but..?

> >I have not tried any other ICONNECT client but after my results with CAB

Whitch "other" client? :-> Emailer?
Fine and realy colorised, not nice to scroll any window to read a simple
message. Unusable for me. Sell it one year ago.

Teli? Not use them. And for what?

Fiffi, nice handling. Some smal bugs, but it works nearly perfect.

And last but not least, edit the config file of IConnect with a txt
editor..
Background:
IConnect setting have bugs under some cirumsdances. I can repeat that.
Anytime i change the setup, maybee to get connectet to another isp,
Iconnect makes trouble while connect the new isp. After delete
the hole setup, create them all new the error is gone. It works.
People how doasnï¿½t chance the setting often have a nice socked.

Package itï¿½s a fine thing, but not gold at all. Sorry.

Hardest point for me: Any socked needs his own clients.

Try to sell the same on any other platform... :->
(Flying tomatos??)

Regards, Robert

> but you need a Milan-060 to be able to run it. I'd say "drop dead"...

Suprise suprise...
The same what i mean, sice -years- here, you only say it in other words.

And another "bad" word too...
People how emulate atari on a other platform buys ANY atari client? :->
Think itï¿½s cheaper to play with netscape or some else.
Netscape also grabs "atari" out of the web.
Why i should buy draconis as example? Sorry for that bad question :>

Some swords have two sharp sides.

Anybody outside used -any- atari software to surf and mail with
a mac, as a second example? :>

Sure, border lightnings..

Love my falcons realy, but i know faster ways to access the web.

Hi
My Falcon is connected to my PC via a serial cable. All informations
about my "network" at the following address :
http://perso.club-internet.fr/agaymatd/network_e.html
I'm using Linux, not Windows, but is could also be possible with a good
NAT program (for IP masquerading) :)

Hi Jo-Even,

maybe, maybe not... I started with the KGMD stuff. Wasn't it december '98?
Ok, not the latest one, but a fairly complete one. Now if you talk about
"what you're used to", translating that into "working with Atari stuff"
it's a whole new world. I've said before, just putting Mintnp in the auto,
creating a small mint.cnf and putting N.AES on top isn't the worst to do.
If you go for the whole bunch, incl. Mintnet etc. it's entirely different.
A learning process. Nothing wrong with that, but one has to choose that or
just stick to the old bunch. Lately their has been a lot of new
development for Mint, so the updates are frequent. Just the other week or
so I installed xfs2 0.54, I think 2 days later a new one came out. Same
with the kernels. I decided to leave it for the moment to kernel 0.9,
Mintnet 1.01 and xfs2 0.54. It works, and I don't care about the rest.
Maybe in a year.
The same will be true for Linux. Constant updates. My intention is to get
a recent stable SuSE dist, install it completely and start *using* it.
Configuration will probably be a matter of weeks, maybe more. Setting up
Xwindow will take some time, I figure. But after that? No constant
updating of modules/kernels/filesystems or what. Another learning process.
Try and use the apps, not maintaining an OS all my free time. If that is
what is needed, then Linux won't run for long on my system :-)

Hi Robert,

...which brings us back to where it all started: CAB being slow and no longer supported (my statement). Two reasons: an Atari IS slow in 1999. And perhaps CAB could be made faster, but we need one certain Alex for that. Which brings in the competition: ooooops, we need to switch stacks. Apart from that, are they usable??? Ermmm...

Yes, the browser being the bottleneck on Atari, I'm looking for a faster one. Which means switching to Linux, in my case... only because I could get a decent machine for returning 4 free days a year on a 3-year basis.

I've just started testing my FX Falcon at 40 MHz with CAB, Dracpack,
etc, and find CAB/STinG on a 28.8 modem feels similar to my AMD K6-2 300
with a 56K modem. If I switch back to 16 MHz, it is hopelessly slow.

Hi !

Just a little message to say that Extendos Gold has been updated and the
new version 3.2 is downloadable free of charge for registered users of
the 3.1 version.
Also a new version of CD Writer plus is available ...
The combination of both new versions allow to use TEAC RDS55 cd
recorders and more of course ...
http://www.cyberus.ca/~anodyne/

It's usually best to remove the plastic case from any electronics first -
this is generally quite easy.

Then use a spray-on kitchen surface cleaner. In the UK these go by the names
of "Mr.Muscle" and "Jif". Work these onto the surface using a nylon brush
which will reack into any fine mouldings. Rinse well in warm water and allow
to dry thoroughly. The surfaces will be so clean that they will easily pick
up grease marks etc. so spray with a silicone based polish and buff-up with
a clean cloth to protect them.

->
->Cheers from Belgium
->Dennis

Hi Dennis. Methinks I hear a rumbling in the distance also! <grin> Anyways,
I just wanted to say that MiNTNet was not particularly hard for me to set
up. Katharine (Ellis) did help me with one problem I had, a script for my
ISP, but that was no different then the trouble I had getting a working
script for STing setup with my ISP. In fact, I actually connected with my
ISP on the 2nd attempt with MiNTnet. I can not tell you how many tries it
took with STing before I got it just right. I know this does vary a lot
from ISP to ISP. I've got IConnect, (it came with CAB), but I do not have
MagiC so I've been unable to try it. Just my own experience... ;-)

PS This is really gonna sound odd, but the only "stack" on
the TOS platform that I ever got working on my own with
no help was NOS/Oasis. Which as you know, most people
think is very difficult to set up. I actually called LD
to ST-Formats BBS just to D/L it after reading a review
in one of their mags... Dedicated, aren't I? ;-))))

Catch ya later...

Source record: 74696

I'm running Win98 and it would take 36 hours or so per unit if I ran it as a screen saver,
since I set it to run all the time it now takes 12 hours or so, this is because it doesn't
need to do a lot of graphics calculations, I'm running v1.06, but if you have an earlier
version you might find it doesn't run any faster as previous versions still did the graphics
calculations when running in the system tray. I'm running a PII 350Mhz.

I did notice when I had a look at text only version of Setiathome that the only version
for the m68k is for an hp computer running netbsd1.3.3 , but when I looked at
the NetBSD web site there is an Atari port of that operating system, but only for
Atari TT030, Falcon and Hades computers, what I was wondering was if anyone
had tried this operating system and the Setiathome client for that hp computer
and whether it worked?

Claggy.

on Sat 14-08-1999 09:03 John Kolak wrote:

>News to me, what happened to Peter?

Hi John,

U're asking me? Recently, people started yelling at Alex to come back for CAB 3.0, since he departed for the BIG MONEY on the Mac platform.

Some time ago, there was a Swede who told us Peter R. had a quarrel with his university about his Internet account. He had took over the support for Sting but at the same time he told us he didn't have access to all the sources so he couldn't do very much.

Well, at least I liked the way he took up the job, at least he told us users there were some shortcomings and at least he told us how to get more out of Sting.

As for Mr. Peter R. himself, how much I appreciate his efforts, I certainly don't appreciate the roughly same way he deserted. Have a quarrel with your university... there's always some way to tell your customers about it. Just NOTHING! Thanks to Ronald we knew about it. In my opinion Peter went the same way as Alex: silent, hush-hush, and I don't like it at all. People wondering why others leave the platform??? Go thinking a while, please!

Yes, I damn' well know this sounds harsh... Isn't it harsh the way we're treated?????? Go figure! Perhaps it's the best thing the Draconis' people could do: introducing a new stack with clients :-(

Just asking you: would you accept something like that from MS? Apart from that you probably paid for it, but nevertheless...

Taking it to the Mint-front: what would you think if Frank Naumann disappeared silently into nothing rite now?

Then again, for Mint the sources are public available, for Sting that ain't the case...

3165. Serious Atari ST (and 8bit) collectors read this

Newsgroup: comp.sys.atari.st
Date: 1999-08-14 00:00:00 UTC
From: Jim Lazarenko <jim_l@NOSPAM.telusplanet.net>
Message-ID: <salt3.6052$k3.507150@news1.telusplanet.net>
Source record: 74698
Cross-posted to:
alt.games.video.classic,comp.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.misc,rec.games.video.classic

A local software development company who at one time developed games and applications for Atari systems, has finally decided to part with Atari goods. Most of it is Atari ST equipment, however there is some Atari Portfolio, Atari 8bit, and IBM development tools included in their equipment as well. We hauled away two truck loads (pickup trucks mind you, but trucks none the less) of equipment and were told that they will round up the rest of the items around the office in the next couple of weeks.

We have already spoken with a few local companies and individuals that we know are using/or collecting ST equipment to see what we could sell off locally, but even so, we will have a good mixture of items that I plan to post to various newsgroups.

This weekend we are trying to catalog all the assorted items, the big stuff isn't so much of a problem, but it's all the small boxes of stuff (like ROMs, manuals, emulators, cables, etc.). However we do have to try all the equipment to make sure it is fully functional and in some cases to figure out what version of TOS is has, size of drive, play some of our favorite Atari games :), etc.

After our local sales, we expect to have the following items still available, approximately 75% of the items are still boxed

Atari 800XLs (at least a couple)
Atari 520STs (1 -5 of them)
Atari 1040 STs (at least a couple)
Atari Mega STs (1, maybe 2)
Atari TTs (1, maybe 2)
Atari Falcon (1 maybe)
Atari B&W monitors (at least a couple)
Atari Color monitors (1 -5 of them)
Atari 20" monitors (at least a couple)
Atari Megafiles (1 -5 of them) varying sizes
Atari Laser Printer XLM804 (at least one)
Atari Tape Backup units (at least a couple)
Atari Modems (at least a couple)
Tons of books, and manuals
Assorted Software and Games
Assorted ROMS
Assorted stuff

Once we catalog everything, I will do a complete and thorough listing and post it to this newsgroup.

I am posting this to forewarn serious Atari collectors that we will begin taking offers on this equipment later this week, and to watch for my follow-up post. But at this time please do not email me as I probably won't have time to respond anyway. I will not respond to any email asking 'do you have this' or 'do you have that' so don't bother.

The same experience here. I had more troubles to get STiNG working then
MiNTnet. I'm using MiNTnet since 5 years now. Never had a problem with it.

You don't need MagiC to use Iconnect. However with the exception of Cab
you do need MagiC to use the Iconnect clients. And that is what I really
dislike. IMHO Atari programs should always be OS independent.

Iconnect only needs a pre-emptive multitasking system such like
Geneva/MiNT or N_AES/MiNT. It's however not so easy to get that thing
working under these OS's. You'll have to play a lot with the starting
order of the autodirs.
Last week in order to do some tests I've used Iconnect a few times. Not
impressed at all. The speed was certainly not faster then with my usual
setup (MiNTnet)

Ah, the good old NOS/Oasis. NOS was very ahead of his times. Long before
one could use multitasking systems on the Atari one could do some kind of
multitasking with NOS/Oasis. Dowload news, mails, do a telnet session and
and ftp session all at the same time without a multitasking system.
I've used it for a very long time. NOS was very reliable, unfortunately
one couldn't say that of the GEM interface for NOS, Oasis 1.35.
BTW: NOS is still under development

I really don't think a Mac is something for me. Actually, the Mac's
fascist OS is just the opposite of what I want ;-) I use PCs at work, and
I find them OK (mostly because we have a slave to maintain them ;-), but
the Macs I've used (including our own iMac) are just plain boring. Sorry
folks, I just don't like them.

Exactly. Some are used to edit configuration-files and install files by
hand, other are used to wizards and flashy(1) GUI-installers. Both would
find the other hard to use.

> just stick to the old bunch. Lately their has been a lot of new
> development for Mint, so the updates are frequent. Just the other week or

You have to remember that this is beta-releases. If you're an ordinary
user then you're better off waiting for the ordinary releases, which
should be both more stable and better documented.

Installing and setting up Suse or Redhat is very easy, atleast if you're
familiar with the terminology and unix in general. It took me around 45
minutes to install Redhat on my PC, then I had it connected to the campus
network with everything up and running (mounted homepartitions, YP,
webserver, X, printers, Samba, everything). This was in January last year,
I haven't touched it since. It has never crashed, I've only shut it down a
couple of times to fix some hardware-problems. Now it's 138 days since the
last reboot (fixed the fan)...

(1) Please note that I don't have anything against flashy stuff, I like it
just as much as the next guy.

Hi!

G>I have been testing ICONNECT on the only client I
G>have,CAB,and find the CAB...flame me if you must...runs better and
G>faster than it does under STING.

What do you mean with faster? When I was using STiNG back then it was no real problem to get +/- 7400 bytes/sec (ISDN) depending on net traffic. I never succeeded to get such transfer rates using I-Connect.

Regards,
Jan

Hi!

DC>Support for IConnect is coming along - already there is Teli (a Telnet
DC>client), with Chatter (IRC) in beta. Pop along to Bengy's MagiC
DC>support page for the latest news on this and IFusion, a gluestik
DC>workalike for allowing the use of STinG and Draconis clients with an
DC>IConnect connection (this latter also still in beta).

Don't get the facts wrong: I-Fusion either allows running StiK/STiNG clients
under I-Connect or Draconis. It won't allow (or atm) running Draconis clients
under I-Connect.

Regards,
Jan

Hi Dennis!

DV>Fiffi: what is wrong with Fiffi? what can the STiNG ftp clients do
DV>that Fiffi can't handle?

Fiffi is a very basic ftp client. I'm using it here too as my provider no longer likes to work properly with STiNG but there are some things that are wrong with Fiffi. You can't e.g. simply delete a folder or upload a folder with files in it. You have to delete all files in a folder first before you can delete the folder and you have to create a new folder first before you can upload the files into it. You cannot change the name of a file, there are no sort and show options like in aFTP and it has no directory caching.
A thing that I'm missing in both I-Connect and STiNG clients is the possibilty to perform chmod comands as they are very important for cgi script installation.

DV>Chatter: IRC program , just released, I'm not saying this is the best
DV>on the Atari platform because I don't know what's available for
DV>MiNTNet, but it beats the STiNG clients hands down.

Nope, first of all Chatter doesn't support a big range of IRC commands as e.g. AtarIRC does. Then it's really a matter of personal choice if you prefer multi window or single window irc clients. Esp. on smaller resolutions multi windowing is a pain. But even in higher resolutions it can get confusing. The thing that I like most on Chatter is the /msg handling as it opens a new chat window which is in this case very useful. In AtarIRC I always have to type /msg nick again and again.

DV>I've mentioned this here before: ICONNECT and STING can be installed
DV>at the same time. They do not conflict. So it's possible to run CAB
DV>using the STiNG socket and Emailer or whatever using IConnect.

Well, I won't like to dis- and reconnect all the time to surf or to email. I think tcp/ip bridges like GlueStik and I-Fusion are the only way to get out of the tcp/ip stack disaster.

DV>Things which can't always be said of the STiNG
DV>clients: difficult setup, bugs, not compatible etc.. You don't agree?
DV>take a look at the hundreds- no thousands of postings that have been
DV>posted from people havings problems here the last year.

Well, when I look at all those thousands no tenthousands of postings of Atarians having problems with their Atari I surely must come to the conclusion that Ataris are in general: difficult to setup, buggy and not compatible.;-)

DV>OXO: I never succeeded in getting connected to my IP with no matter
DV>what version of Wensuite.Trying to load a quite simple html page

DV>offline (2 frames, 1 animated GIF) still gives me bombs. So this is
DV>definitely a nono.

Well I saw quite a bit of positive development in the latest 3.12b. But again
Wensuite needs his own stack.:-(

Regards,
Jan

Hi!

DV>I-fusion
DV>which is now in beta stage will probably fix the stack problem. This
DV>program will allow LOA and STiNG clients to run under the IConnect
DV>stack.

Nope. Again: I-Fusion currently allows running STiNG/STiK clients under either I-Connect or Draconis.

DV>Since MagiC will be the OS on the new Milan, this thing might
DV>sort itself out. I think that IConnect will be installed as the stack,

Well, I-Connect is mentioned to be included (http://place2be.de/archive/axro.htm) but no other I-Connect client. They'll more probably go for Draconis which is BTW the easiest to setup of them all. That's why I-Fusion also exists for Draconis and why there is a Chatter version for Draconis.

DV>with LOA running as client, the clients that are missing like IRC,
DV>gopher, telnet etc.. are already available as STiNG and IConnect

What gopher client exists for STiNG/IConnect? Telnet is already available for Draconis and IRC (Chatter) as well.

DV>clients. That's the nice thing about commercial software, the market
DV>tends to sort itself out.

Yes, but is that nice? (see http://www.microsoft.com/)

Regards,
Jan

Hi!

JES>Sorry Dennis, this "fact" is very easy to change, I can easily make
JES>IConnect 90% slower than STiNG if I want... It's basically just a
JES>matter of configurations and ISPs. With some ISPs IConnect works
JES>best, and with some it doesn't work at all. The same applies to STiNG.

Ahh, so that must have been the case with my ISP as STiNG performed far better.
Actually now STiNG no longer works but I-Connect. Do you know some settings I
can play with to get better transfer rates?

Regards,
Jan

3175. Re: WTB : Cab 3.0 !!

Message-ID: <199908142313.a23603@kr.maus.de>
Source record: 74708

Hi!

DV>Well, all of the above can be done
DV>by Fiffi just the same, and a wee bit more :-)

It can't! You cannot download a complete folder. Ever tried to select a folder and dl it? In addition: you cannot delete a complete folder and you cannot upload a complete folder. And where is the directory caching? And what wee bit more? The GEM Script support is nice indeed.:-)

DV>What was getting on my nerves was the constant
DV>IConnect bashing here in this newsgroups.

Yes, some people on this newsgroup might tend to bash ASH/MagiC/I-Connect which is of no use of course. But that's no reason to glorify ASH/MagiC/I-Connect on the opposite.

DV>It's like the
DV>discussion in the Dutch Mailinglist a couple of weeks ago where
DV>someone declared that Papyrus was "the best wordprocessor on our and
DV>other platforms". Statements like this make me climb on that famous
DV>white horse. As long as one hasn't tried out the competition or at
DV>least knows what it might be capable off he/she should keep his/her
DV>mouth shut.

So it's nice that you have this attitude but you're praising I-Connect clients and bashing STiNG clients and (quote of an older message)

DV>The last year I haven't tried a single STiNG client. Why should I?

So you're doing exactly what you didn't like others to do...

Regards,
Jan

>I think you missed the point - IConnect only works under MagiC

Is it really so? About a year ago a guy demonstrated to me web browsing
with CAB using MiNT + N.AES + Thing + IConnect, and after that I tried it
at home in a MultiTOS-like environment: MiNT + AES4.1 + IConnect, and
connected immediately and surfed the web for about 30 minutes without
noticing any problems. I admit that I did not try everything in CAB, though,
neither did I try any other client. Are there some finer details that do not
work correctly, or what?
Why does everybody say that MagiC is needed for IConnect?

Btw. the above was just for the sake of an experiment, generally
I use TOS2.06 + STiNG; AES4.1 is too slow on my Mega ST and does not
succeed to run a couple of programs that I like.

3179. Wang VS emulator

Newsgroup: comp.sys.atari.st
Date: 1999-08-15 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <37b70a91.1405471@news.wxs.nl>
Source record: 74546

I have a question for those of you that know what a Wang VS is,
or for those of you that know somebody that uses/used a Wang VS.
For those of you that do not know what a Wang VS is, it is
a mini.computer with an instruction set similar to the IBM 360
and 370 series.
During the past 8 years, I have been working on an emulator that
will allow you to run programs designed for the Wang VS. I have
been writing this program using Turbo C on my Atari ST Book.
I ported this program to the PC too, so now this program is
available for downloading on my homepage. The reason that
I put the PC version on my web-page is that my ST-Book is
just too slow to run the emulator at an adequate speed. But
since I like Atari systems better than PC's. I was wondering
whether there are Atarians out there that would like to use
the Atari version of my emulator. If you would like to try the
ST version, let me know. You can send me a message by
sending E-mail to ernest@wxs.nl so that I can find out if some
people are interested. If you want to try the PC version, you
can download it right now from my home-page at
http://home.planet.nl/~ernest

Regards, Ernest.

You're right, it will work under MiNT as well - if you're lucky. I managed
to get it working on my Falcon with MiNT+N.AES, but it it was not easy...

Hi Ernest,

yup, we use Wang VS at my working place, mainly for the administration
sectors. Intended to switch to NT in about 1-2 years from now.
We're running a VS-6000 server, the clients are mostly Win-95 machines
working with Lightspeed on it (thru' Netware).

>If you want to try the PC version, you

I'll see if I can give it a try on the PC's at work sometime.

Last Updated 08/15/99
Atari 8bit hardware added
Atari Portfolios and accessories added
Atari ST hardware and accessories added
Atari ST Software added
Atari ST Manuals added

As promised, here is the listing of Atari items that we have cataloged so far. I will continue to update this post as we go through the rest of the equipment or sell items off. Please see the original post for the story behind all this equipment. I have incorperated all the new equipment into my regular style of post and added in some of the items that I/we already had laying around. All the Atari equipment has been tested and appears to work fine, however the IBM development tools and hardware has not. We have no reason to believe that it won't function properly as the majority of all of the added equipment is in very good shape and boxed. If you have any questions please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post. Please note that I am in Western Canada, so shipping to the US will be slightly more expensive on larger items (however if you are in the US, you have the exchange rate on your side).

If you are interested in any of these items, please respond to Jim at classic.games@NOSPAM.telusplanet.net (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Colecovision, Intellivision, Classic Computer or Handheld games) sent to you, please specify system.

Hardware Please make an offer
==========
Please note that at the time of this posting, there are multiples available of many items
- Atari 600XL - with power supply, RF cable
- Atari 800XL - missing power supply
- Atari 800XL - with power supply, RF cable
- Atari 520 ST - with mouse but missing power supply
- Atari 520 ST(s) - Boxed with power supplies and mice
- Atari Mega4 ST(s) - with keyboards/mice and power supplies
- Atari TT030 - with keyboard/mouse and power suppy
- Atari TT030 with built-in SCSI Harddrive - with keyboard/mouse and power suppy

- Atari PCT1426 13" Monochrome TT Monitor
- Atari TTM195 20" Monochrome TT Moniters
- Atari SF354 3.5" Floppy Drive - with drive cable, no power supply
- Atari SLMC804 Laser Printer Controller
- Atari SLM804 Laser Printer - boxed with power supplies
- Atari Megafile 44 with built-in Tape Backup - with power supply and cable
- Atari Megafile 60(s) - with power supplies and cables
- Atari Portfolio - with box and manual
- Atari Portfolio(s) - missing box, manuals
- Atari Portfolio PC Card Drive - Complete with box, manual & software. Like New
- Atari 5 Volt Power Supplies. Model C061982. 7 Pins.
- Magic Sac 1 Mac Emulator Cartridges (with manuals, NO ROMS)
- Custom made Atari RGB/Audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
- Custom made Atari ST Composite Video/Audio cable (standard RCA jacks) Connects an Atari ST to any composite monitor

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 2x Wico Joystick (Black handle with grey base) - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

8-Bit Cartridges Please make an offer
==========
- Atari Writer
- Basic
- Defender
- Donkey Kong
- Donkey Kong Junior
- Final Legacy
- Megamania - In a sealed/shrink-wrapped box, box is slightly squashed.
- Missle Command
- Moon Patrol
- Pole Position
- Realsports Football
- Robotron: 2084
- Star Raiders
- Tennis

ST Software Please make an offer
==========
- UltraScript for MEGA ST- by Atari (with manual & software)
- Ultra Script Type Collection - Packages 1-7 (Complete with box, manuals, & software)
- Macro Mouse - The mouse recorder (Complete with packaging, manuals, & software)

- Calamus Desktop Publishing (Complete with box, manuals, & software)
- Spectre GCR Mac Emulator with ver. 3.0 update manual (Box, manuals, software - NO ROMS or cartridge)
- AtariWorks - by Atari (with manual and software (unopened))
- MidiMaze - by Hybrid Arts (Complete with packaging, manuals, & software)
- Flash Telecommunications package (Complete with packaging, manuals, & software)
- Flash II Telecommunications package (with manual and software)
- Dungeon Master - by FTL (Complete with box, manuals, & software)

IBM PC Development Packages/Software/Hardware Please make an offer
==========
- Borland C++ - by Borland (software only 7 Disks)
- Turbo C - by Borland (software only 6 Disks)
- Turbo Debugger - by Borland (software only, 2 Original Disks + 2 Accessory Disks)
- Turbo Assemble - by Borland (software only, 1 Original Disk + 1 Accessory Disk)
- Gem Applications - by Digital Research. Contains GEM/3 Desktop Installation Guide & software, Fontware Installation Guide & software, GEM Artline manual & software, Digital Research Customer Support Guide, Gem/4 software.
- ShowTune Midi Transcriber - by Thought Processors
- The Note Processor - by Thought Processors
- Voice I/O Card (model VRP-70C) - by Compunic Electronics (complete with card, manual, & software)
- PCD-GM Midi Interface Sound Card - by Midi Land (cards alone)
- Portman PC/P Midi Interface for the PC Parellel Port - by Midiman (complete with hardware, software and manuals)
- PCD401 CD Sound Board - by Midi Land (Hardware and manuals)

Miscellaneous Software Please make an offer
==========
- Equate - by Holosoft. Spreadsheet software for the Apple Newton (complete with box, manual, and software)

8-Bit Books Please make an offer
==========
- Consumer's Guide "The Users Guide to the Atari"
- Compute's "Third book of Atari"
- Compute's "The Atari Basic Source Book"

ST Books Please make an offer
==========
- Atari ST Volume One VDI
- Atari ST Volume Two AES
- Atari Volume Three TOS
- Atari ST GEM Programmers Reference
- Atari ST Tips & Tricks
- Atari ST Internals
- Programmers Guide to GEM

- MC68040 32-Bit Microprocessor Users Manual - by Motorola
- MC68000 8/16/32-Bit Microprocessor Users Manual (eighth edition) - by Motorola

Manuals & Technical Guides (software status specified) Please make an offer
==========
The majority of the ST/TT manuals are of the binder variety
- Atari 800XL Manual and connection guide - by Atari
- Atari 1050 Manual - by Atari
- Portfolio Technical Reference Guide (Third Edition June 1991) - by Atari (with software)
- Micro C Shell - by Beckemeyer Devlopment Tools (without software)
- LDW Power Spreadsheet - by Logical Design Works (without software)
- Superbase Personal - by Precision Software (without software)
- dBMan - by Atari (without software)
- 1st Word Plus - by Electric Distribution (without software)
- HyperPaint - by Atari (without software)
- Easy Draw - by Migraph (without software)
- Regent Base/ Regent Base 2 - by Regent (without software)
- Publishing Partner Professional / PageStream -by Soft Logic (without software)
- Publishing Partner - by Soft Logic (without software)
- Touch-Up - by Migraph (without software)
- Microsoft Write - by Atari (without software)
- Codekeys The Macro Tool - by CodeHead Software (without software)
- Degas Elite - by Intregal Sollutions (without software)
- Brataccas - by Psygnosis (without software)

Magazines and Specification sheets Please make an offer
==========
- 1983 Atari 800XL Brochure
- 1986 Atari ST Computer Brochure
- Start - Premiere Issue Summer 1986
- Start - Spring 1988
- Start - November 1990
- Start - December 1990 (with disk)
- ST-Log - January 1987
- Antic - February 1986

Atari Force Comics
All are in Mint Condition
==========
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #9 - September 84
- Issue #11 - November 84
- Special Issue #1 - 1986

Trades
==========

I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar and Jaguar CD
- A CD64 Nintendo 64 Backup Unit
- A working Vectrex controller
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

3185. Need NOVA drivers 2.08 MSTE

Newsgroup: comp.sys.atari.st
Date: 1999-08-15 00:00:00 UTC

Message-ID: <7p7b19$r93$1@as102.tel.hr>
Source record: 74552

I have NOVA card MSTE/TT version...
Well, it works in TT with driver 2.08, newer versions works weird
(colours are green, 32k, 65k, 16M modes don't work at all)

I decided to put this NOVA in Mega STe, but I have drivers 2.08 only
for TT, not working on MSTE.

Anyone could help me?
Vuk

Thanks for the reply, Peter.

I've tried all this, without success. I'm starting to believe that it is a problem with the Host Adapter card(s) and not the hard drive, since when I try to access the hard drive, a message pops up saying "Host Adapter not found".

If there is a problem with the host card, what can I do to fix it?

Source record: 74555

Greetings,

I am contemplating setting up StinG.
The Docs seem to be in a different format.
Hypertext or something like that.

I think, in order to read them you need ST-GU15
The Docs for ST-GU15 are in German.

Is there a site where I can pick up English Docs for StinG?

Thanks for your help

ken

Thanx. I will take a look instantly :-) I don't need masquerading as
the TT only needs to get mail and news from the pc and not connect to
internet directly via pc.

> latter also still in beta).

Yes, Support for I-Connect is surely increasing. On a related note, in a past email with Thomas Much, he told me he will probably release the source code for T2 (The First telnet client for Iconnect, included with later versions of CAB) quite soon, if anyone is interested. About I-fusion: Currently, there are two versions of the program . One for Draconis and One for I-Connect. Unfortantly, It seems that Ifusion will not be free, or even shareware, as GlueSTiK is . It will be sold as its own program, the Draconis version by M.u.C.S. How it will be sold by ASH has not be determined yet (Whether or not it will be packed in with CAB, sold as it's own, etc etc)

There are many reasons why I use I-Connect as opposed to Sting. One of the main ones being IRC. I enjoy to go on #atari(scne) while I update my webpage(s) under MagiCMac. On my Falcon I can use AtarIRC with no problem, but the later versions purposely do not work under "emulators" such as MagiCPC/Mac. The author, Lonny P, does this because he says he does not want to support Atari Emulators. That's fine, it's his decision, but because of this I really am forced to choose between FracIRC and Chatter. And between those two, Chatter wins hands down. I've never quite understood why many atari users can not comprehend that some people who use MagiC Mac actually use it as their MAIN Operating System. I know of many MagiCMac users who only use the MacOS for the odd program, and actually have MagiCMac boot up automatically when the Computer is turned on.

Anyways, I will soon be following in the footsteps of the X-Online (Now Place2Be.com) and will be registering my own Top level Domain name. I've narrowed it down to a few, many of the one's I wanted were already registered. It is now between: MagiCOS.Com MagiC-OS.Com MagiCBen.Com :-) MuchMagiC.Com (Only Canadians will understand this one I think ..ie "MuchMusic" :-)) EnjoyMagiC.Com And then there is Dennis V's suggestion, MagiC-Rulez.Com

Anyone have any thought on which one of these I should use? I would take a vote but I'm too lazy :-)

Robert Schaffner <doitarchive@atari-computer.de> wrote on 14-08-99:

Hi Robert,
>Forget that. CAB works also realy fast ans stable with STinG.
>IConnect isn`t the latest word in socket technical..
>If you have different results in the form of 25%, anythig of your STinG
>installation is wrong.
According to Jo Even Skarstein this is just bad luck, I should switch to
another IP, a STiNG biased IP that is.

>Mostly i got more cps with STinG on the same site.
That's being lucky, you surely must have a STinG compatible IP

>Most clients for STinG are free. IConnect too?
>You got a free client for Iconect?
Yep,and so have You :-) Fiffi comes bundled with CAB

>Have a look for english releases, you got it 5 month (ore more??) after
>a new german release. Authors can build also english .rsc files, but..?
You know Robert, we're moving on...
IConnect 1.7 was translated five days after it's official release and ready

to download. In fact it was ready before the major Atari dealers had it in
stock. Fiffi was done a couple of days later. Since then two versions of
Teli and three versions of ASH Emailer have been translated, including the
bubblehelp files. In fact every single IConnect client is translated and
can be downloaded from http://bengy.atari.org section translations.

>Whitch "other" client? :-> Emailer?
>Fine and realy colorised, not nice to scroll any window to read a simple
>message. Unusable for me. Sell it one year ago.
You're talking about version 1.0, how many STiNG clients are perfect from
day one?

>Teli? Not use them. And for what?
For Telnet

>Fiffi, nice handling. Some smal bugs, but it works nearly perfect.
Since, you're not aware that Fiffi is now bundled with CAB, surely again
you're talking of an old version..... I have yet to see the first bug in
version 1.11

>And last but not least, edit the config file of IConnect with a txt
>editor..
Why do you edit the config file with a text editor, if you need to change
the settings, use IConfig....

>IConnect setting have bugs under some cirumsdances. I can repeat that.
>Anytime i change the setup, maybee to get connectet to another isp,
>Iconnect makes trouble while connect the new isp. After delete
>the hole setup, create them all new the error is gone. It works.
>People how doasn`t chance the setting often have a nice socked.
For a start you could try using IConfig, instead of a text editor. You do not need to change any settings at all. Just create a new set, you can create a set that uses the default settings, or create a set whitch uses your previous settings...

>Package it`s a fine thing, but not gold at all. Sorry.
Reading the manual might perhaps help ?

> Like announcing new s/w for the "Atari"
>> but you need a Milan-060 to be able to run it. I'd say "drop dead"...
>
>Suprise suprise...
>The same what i mean, sice -years- here, you only say it in other words.
Be serious, I can say this everytime someone releases software for the Falcon. Let's delete all software that make use of the DSP??

Cheers from Belgium

Jo Even Skarstein wrote on 13-08-99:

Hi Jo, :-)))
>It's good to have you back Dennis, it's been boring here without you.
You aint seen nothing yet

Well well, Jo, I feel honoured, four replies!! since you wrote these on a friday evening, and we agreed that pigs might fly on friday evenings, I'll take this in account here.

>I definitely know about at least two very pissed off IConnect-users
>(actually, I only know two IConnect users...).
Is that a statement or a remark?

>Sorry Dennis, this "fact" is very easy to change, I can easily make
>IConnect 90% slower than STiNG if I want... It's basically just a matter
>of configurations and ISPs. With some ISPs IConnect works best, and with
>some it doesn't work at all. The same applies to STiNG.
Stupid me, I should have realised that there are IConnect biased and STiNG biased ISP's out there, sorry Jo.
Please explain how I can make IConnect 90% slower, I've entered minimum values everywhere I could, and with these settings I'm still a couple of percents faster. I blame my IConnect biased ISP for this, he probably overrides my settings.

>Until you've tested IConnect, STiNG, Adamas, WenSuite and MiNTnet on
>several different ISPs, with several different machines, different
>clientsetc. it's just plain stupid to claim any "facts" at all.
I use IConnect, and used STinG, I've tested Adamas and Wensuite. Four out of five isn't that bad is it. I also wrote that I would not comment on MiNTNet yet.

>Excuse me? STiNG was recently updated AFAIK. MiNTnet has been updated
>several times the last few months. IConnect is also a pure dialup-stack,
>hence unusable in a LAN.
STiNG has been repackaged, this is not exactly a update. Like I said, I will make no comments on MiNTNet (just give me some time)
IConnect is a dialup-stack indeed, so are, Wensuite and Adamas. STiNG is a bit of a mix, but under TOS and MagiC it's a dial-up stack.
Who mentioned LAN's here? Throw LAN out, it is not invited in this discussion, wrong topic.

>IConnect only works under MagiC, so even if these clients are as wonderful
>as you claim, you're forced to buy MagiC to use them. What if you want to
>use EMailer, but also like to use memory-protection and Paral when you
>program? Dual-boot?

Perhaps, why not :-) I can claim exactly the same. I'm forced to install
MiNTNet and if I want to use Emailer what are the options? Dual-boot?

>Emailer sucks. Period. It recently got some *extremely* useful features
>(like background images and *true* smilies)
Come on Jo, You can do better then that.

>but aMail is still the choice if you want functionality.
I like the soundsamples feature this is really functional

>Running local news-clients over a modem is a pain, the absolutely best and
>fastest way to read news is to telnet to a fast box with a fast connection
>and use tin, knews or something similar. They're not pretty, but very fast
>and very functional.
Is that a pig flying by? No, you're really serious aren't you? On average
I pull in about 120 postings daily. I guess most of us here do that, do you
really expect me (us) to begin tinning and knewsing ? If that is the only
alternative you can offer..... :-))) (very big but wary smile)

>*Cough*... Teli works, but that's all. The good old BSD-telnet is still a
>lot better. The telnet-clients for STiNG are not good though, most of them
>have serious shortcomings in their terminal-emulators.
BSD, who invited NetBSD to this discussion? I simply said that Teli works
flawless, and the STiNG clients are not suitable. What kind of simple soul
is going to install NetBSD just to use telnet?

>> I've mentioned this here before: ICONNECT and STING can be installed at
>> the same time. They do not conflict. So it's possible to run CAB using
>
>Try being online with both at the same time... I would think that anyone
>who starts with such a dual-setup will end up using just one of them after
>a while.
Why not? I've done it six months like this. You have the best of both
worlds, and yes, one will probably end up using just one. The one who's
suited best for ones needs, in my case it was IConnect.

>Geir Vi¿½lidalo, are you listening? I told you so, it's not the software,
>it's just you. You're obviously a complete idiot since you can't even get
>Emailer to work, while I'm probably the genious here, since I don't have
>any problems with my MiNT-Net and STiNG-clients.
Perhaps Geir had a lousy advisor? you do know that there is only a very
fine line between sheer genius and being complete cookoe?
Geir are you listening? contact me.... when you have a problem you should
get advice from the specialists. When you're feeling sick I suppose You do
go and visit a doctor instead of the local vet?

>> Things which can't always be said of the STiNG clients: difficult setup,
>> bugs, not compatible etc..
>>
>"Facts" again Dennis?
Facts, oh dear, stupid me. Of course: STiNG comes with a very nice easy to
use setup installation program. All the clients share the same nice users

interface and commands, the keyboard shortcuts are generalised, the HYP help files are outstanding, all the clients are highly integrated and are able to use script files, automating some tasks. Since all the clients have been beta tested very intensive, bugs are minimal, bubblehelp is integrated to help the uninitiated. Each client can individually make the connection and deconnection to the net, making automated access a breeze. Ah, why am I writing this, you use STiNG clients, so you know them better then I do. Well, the IConnect clients luckily can do these things also.

>> You don't agree? take a look at the hundreds- no thousands of postings
>> that have been posted from people havings problems here the last year.
>>
>Ahh, proof...
Nah, not really. I suppose that like Geir these people are all complete idiots, not even capable of installing a simple program. You're right, postings of people reporting problems, bugs or asking for help should be denied completely from now on. Let's make this offical CSAS policy.

>>Instead of concentrating on all the clients, the programmers better would
>>put more efforts in getting the browser right.
>>
>What? And why doesn't this apply to ASH? Ditch IConnect and put some
>effort into the clients instead...
Because the clients are written and here to stay, try them out just for once, so you know what you're criticising. Oh, I forgot, You can't get MagiC installed properly, does that mean You belong in the same category as Geir V. ?

>Bulls**t. It's just a matter of...
>
>a) What you're used to.
>b) What you like.
>
>If you're used to the unix-way of setting up stuff, you'll probably find
>flashy GUIs hard to use as well. NT is a good example of how horrible a
>GUI can be to do such tasks.
Give it up Jo, this discussion/topic has been here several times before. I use the ST since day one, in 1985 declaring the statement above would have been acceptable. I haven't been in touch with command shells and the like since say 1986. After 13 years, it's time to ditch the GUI, and return back to the commandline/shell, just to be able to connect my Atari to an outside cable Ethernet?. The guys who turned MiNTNet into the monster it is today should be publicly crucified. it's about time the MiNT developers make their minds up. What do they want? a OS that's used and enjoyed by as many users possible, or the opposite, a OS written for a small group of people with specific needs.
Linux is installed on more and more PC's, why ? Windows sucks all of a sudden? Perhaps it's because with every new release the installation and set up gets easier. The easier to install, the more people who will jump on the bandwagon. The MiNT developers should keep this in mind, before releasing a new version they should perhaps invite a complete idiot (one

like me) and see if he manages to get it running, if he can't, ditch it and go back to the drawing board...

>Hehe... It's rather sad to se an otherwise intelligent person write such
>crap... You obviously have no idea what MiNT-net really is. MiNT-Net is
>harder to set up for some people, because it doesn't have wizards and
>GEM-frontends, but it's also incredibly powerful compared to the other
>stacks around.
I know MiNTnet is powerfull, and I am about to find out all about it real soon. In the meanwhile a stupid question: why did the programmers leave out a GEM-front and wizards? I'm convinced you're going to give me a very intelligent answer....

Cheers from Belgium

I use MasterTracks Pro v3.6 in 800x592x16 colour under Videl Inside. It works great. MasterTracks may be available second hand if you ask around. A few wee bugs exist (no save preferences is worst, incorrect VDI colour handling is only other worth noting) but other than that is hasn't crashed on me in the whole 4 years I've used it on my Falcon...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

With my 1040STe, I got sick of the yellow-ish plastic too. Last time I took it apart (to transplant a better floppy drive into it) I took the top of the case outside, masked off the power & disk drive LED windows and the Atari logo, then hit the sucker with spray paint. This was after using a tiny flat file to enlarge the cooling slat holes near the power supply. The thing runs cooler now, and looks great. It was grey primer auto paint, BTW. One could just as easily go candy-apple red if one wanted to.

> modem properties I guess.

Yeah checked all that. It just doesn't work with the internal modem. Works
fine with my old USR Sportster plugged in (at 28.8 rather than my lovely new
PC internal 56k modem). Thinking about it, it's probably because my internal
PC modem is not so lovely after all. It's what came with the PC, hence it's
a cut-down, OEM version of a USR 56k Voice-Win. It's probably the fact it's
a WIN-MODEM that is the problem!
I guess I'll just have to live with my old modem for MagiC-PC for now, until
I eventually upgrade to a proper PC modem (not a WINmodem).

Gary

3200. Falcon as X terminal

Newsgroup: comp.sys.atari.st
Date: 1999-08-15 00:00:00 UTC
From: Alain GAYMARD <agaymard@club-internet.fr>
Message-ID: <37B68B42.CC0AA2D2@club-internet.fr>
Source record: 74722

Hi
I've a linux box (PC) and two Atari. One of them is a Falcon, and I'd
like to use it as a X terminal. Is it possible (using MiNT ?). I know
that my Falcon is quite slow without accelerating card, but it could be
a nice monochrome X terminal. I've not found anything yet on the net.
Does any one have a solution ? I don't want to install Linux on ma
Falcon, I know it works fine, but it is a bit slow...

You read my mind, This is something I've been needing for quite some time
now. .... I wonder if Juergon plans on adding this..

> Nope, first of all Chatter doesn't support a big range of IRC commands as e.g.
> AtarIRC does. Then it's really a matter of personal choice if you prefer multi
> window or single window irc clients. Esp. on smaller resolutions multi
> windowing is a pain. But even in higher resolutions it can get confusing. The
> thing that I like most on Chatter is the /msg handling as it opens a new chat
> window which is in this case very useful. In AtarIRC I always have to type /msg
> nick again and again.

Which commands are these? I have not noticed, but I just use the elementary
features of IRC. I agree the multiwindows can get cluttered, but on a whole
I do think it is an advantage. I do prefer Chatter over Airc. Features like
the Hotlist and as you say the message window are nice. So is the Channel
list window and the Names window, its much nicer then just the nicks in Airc
which are displayed on the botom of the page. Plus, if cosmetics means
anything, I really dont think there is that much of arguement about which
client looks better.

PS; in AIRC just press TAB and you dont have to type in the /msg nick over
and over again :)

Take Care Ja

Hi Joe,

well tks for the URL but rite now I've been unable to connect. All my ISP
says is "unable lookup DNS". Either the site is down or has moved... any
info? This has been for the last 36 hours or so.

Hi Jo-Even,

I haven't seen any anouncement elsewhere, but in the German Mint/MTOS
group they were talking about a graphical program to set up Mint.cnf.
Think it's called Mist or something. Woller&Link announced a front-end to
handle Mint.cnf and NAes.cnf graphically. Perhaps a good thing for newbies?

OTOH, I would certainly prefer a nice shell to handle config files in case
you have nothing more than the kernel and basic stuff incl. Xwindow. Same
applies to a Mint setup with no AES. Just think of editting all the
configs in VI :-) Eeeeeekkk!

Louis,

Hmmm... THAT'S annoying. :-(

The SETI@home page has had some problems, but I've been accessing them off and on throughout the past few days. You may have just been unlucky enough to have hit them during a few 'episodes'.

I re-tried the link I sent you and it worked just now, so I'd recommend trying again. I don't know what to recommend if that fails (other than wiping out your DNS cache, of course). There is also a NewsGroup that has a lot of SETI@home people floating around... alt.sci.seti. It might be worth cruising around there and asking if anyone else has had persistent problems with connecting to the site.

As I said in a previous post here, I'll be trying to install NetBSD on my TT and trying the software version for it. I'm not looking forward to trying to install yet another OS, but if it works I'll be a mighty happy camper.

SETI@home just passed one million participants, by the way. That's not as great as it sounds though. Out of the million, there are about 372,000 that have turned in at least one block of data in the last 2 week. Plainly, the majority has either lost interest or decided against participating.

Keep on trying and let me (us) know if you have any luck.

Take care,

Joe Mirando

Thatï¿½s normal for both stacks here. Doasnï¿½t forget that not all have
ISDN. Maybee they all use them with analog modems, a point of much
differend transfer rates. Also between both stacks. With a simple
analog modem i got allways the best results with STinG.
With ISDN they both neary even.

> That's being lucky, you surely must have a STinG compatible IP

I donï¿½t know what ISPs in other countrys are doing.
Think they use the same server software as here?
STinG works fine with ARCOR, MOBILCOM, T-ONLINE and my bloody privat ISP

> Yep,and so have You :-) Fiffi comes bundled with CAB

Yes, and you payed for. Same price as for CAB, but more contens.
Sure the bundle is cheaper, but not free. People with free CAB 1.5
doasnï¿½t have it.

> to download. In fact it was ready before the major Atari dealers had it in
> stock. Fiffi was done a couple of days later. Since then two versions of
> Teli and three versions of ASH Emailer have been translated, including the
> bubblehelp files. In fact every single IConnect client is translated and
> can be downloaded from http://bengy.atari.org section translations.

Sorry. Looks like the first time with that speed. A lot of people
outside germany talk an other language. Manybee in the direction of
3-5 month. Nice to hear they all got actuall updates faster.

> You're talking about version 1.0, how many STiNG clients are perfect from
> day one?

Anyting of design and outfit are changed since V 1.2?
Iï¿½m not sure. Many people here also talking around lost messages.

Sure, other clients are not perfect too, that isnï¿½t what i sayd.
Any software have bugs, but whatï¿½s better?
You payed for or you got it for free?

> you're talking of an old version..... I have yet to see the first bug in
> version 1.11

What i used too.
If the connection goes stuck or lost while any transfer is running
Fiffi stucks too and i can kick them out from MagiC. No chance to
reactivate ftp connection. After restart FIFFI you can start transfer
again. Also with the latest IConnect release.

Itï¿½s not anytime while a transfer runs, but i see that..

> Why do you edit the config file with a text editor, if you need to change
> the settings, use IConfig....

Sure, i doasnï¿½t need that, but what do you like to do you have trouble
like my description? No chance to change anything. IConfig canï¿½t help
in this moment.

> For a start you could try using IConfig, instead of a text editor. You do
> not need to change any settings at all. Just create a new set, you can
> create a set that uses the default settings, or create a set whitch uses
> your previous settings...

Yes, yes, yes

Must be a problem of my description..

So iï¿½m sure you can gave me a description what i have to do if the
actual setting wonï¿½t work from one to the other minute?
All settings in IConfig looks like that what i wrot into days before.

I have to eat them?

Why the same settings are working again AFTER delete the PPP folder and
retype the SAME parameters in?

Use the SAME parameters for FreePPP / OT (Mac) and for STinG.
Use with that parameters the same ISP(s)

Any suggestion?

Must bee magic or iï¿½m dreaming. Why 2-3 other users here have the same?
Must bee only a dumb german problem.
Equal, it works.
But itï¿½s a good sign, for me, that even isnï¿½t all gold around.

> Reading the manual might perhaps help ?

Whitch manual? 1.5 pages out of CAB 2.7 manual?
Soundï¿½s a bit kiddy.

> Be serious, I can say this everytime someone releases software for the
> Falcon. Let's delete all software that make use of the DSP??

Yes. Delete them all. Nobody sayd what you wrote.

But anybody says one or two -perfect- TCP/IP stacks for ANY atari
machine with any OS would be nice, not -five- different and incompatible
stacks.

One for each machine? :->
Two stacks more, next year, for the next upcoming clone? :->

Further than, that saves time for -other- developments.

-Software- keep the system alive, not the -fivth- release of any
stuff we allready have. Not the 1000 senseless discussion about..

More as one developer here have the chance to do that, but they all
looks for me like the three apes, one have the hand over his eyes,
second put fingers in his ears and the third put hands over his mouth..

Simple smaltalk can manage that.. "Hey come over, have a look what
i programmed here, any ideas about.."

Must be realy hard.

Iï¿½m not sure why some people say this, nobody can hear it.

I have sayd what i have to say. Discussion ends here for me.
Iï¿½m not the prayer of the nation. They all must know what
they are doing. Not more relevant for me..

Regards, Robert

Not enough command lines?

Somehow I think a great deal of your computer knowledge would be wasted
with Mac OS. (I am not being snide here.)

Personally I prefer fascism over anarchy ;-)

Yes, I know about this. It's supposed to be bundled with the next N.AES
release. There are already a couple of similar programs available, one of
them by (IIRC) Marc-Anton Kehr.

> Think it's called Mist or something. Woller&Link announced a front-end to

Definitely. And not only for newbies, but for most people that's allergic
to editors and/or keyboards.

> configs in VI :-) Eeeeeekkk!

VI is not a text-editor, it's a religion. Don't ever touch it. Personally
I use pico if an AES is not available (very rarely).

From: louis@holleman.demon.nl
Message-ID: <37b6d10af1ec90@holleman.demon.nl>
Source record: 74737

Hi all,

well, to continue this thread and at the same time getting on, thanks to the Dutch "Stichting ST" I am now able to evaluate Wensuite. I had 3.12 lying around here, and I must say: after filling in the details I had the stack up and running. 2 minutes work at max. And it runs parallel to Sting.

First of, what strikes me is the following: Wensuite appears with a menubar of half height, all text in there looks weird, but is readable.

So is its own icon bar, but the icons only show up half.

All the config menu's: small, sometimes unreadable.

This happens both under MagiC and under plain TOS (3.06). Should I go back to the Atari systemfont?

Next: it loads from the web and it does it fast. However: no pics. When loading from disk it shows pics, but not very nice. Some moving GIF's are not displayed at all, some are but without motion. All colors: weird, to say the least. That's both in 256 colors and in TC.
Other colors (like defined bg colors) show up OK.

When trying to change fonts in the config menu, it crashes as soon as you click a font specification. Both under MagiC and TOS. Simply returns a 69 error.

Afterwards I fetched 3.20a from Oxo's site, but behavior is exactly the same.

Another strange thing: first time I dialed up, it did the job OK. After a short connection I quit, went out of Wensuite and later tried again. It complained about my buffers being too small... I finally set every buffer in every HS-Moda program I could find to something like 8k and next it didn't complain any longer. (I had a few buffers still set to 256).

Could it be that I need to set the config to PCI-ISA? It's now plain Atari here and it runs OK on the card. The Matrix option doesn't work (greyed out).

So far I haven't been testing the News, Mail and FTP stuff, but that will follow later. My french is being tested again, and it's not that good!

>>some it doesn't work at all. The same applies to STiNG.
> Stupid me, I should have realised that there are IConnect biased and STiNG
> biased ISP's out there, sorry Jo.

Don't be silly. You know just as well as I do that ISPs differs quite a
lot. 99% of them just test with Wintel-machines and never bothers with the
tiny majority that doesn't use these.

> Please explain how I can make IConnect 90% slower, I've entered minimum

No problem: Connect to the Norwegian ISP "Nextel". They suddenly changed
their configuration a couple of months ago and I-Connect has not worked
properly since.

> STiNG has been repackaged, this is not exactly a update. Like I said, I

No, STiNG has been updated. Read the docs.

> IConnect is a dialup-stack indeed, so are, Wensuite and Adamas. STiNG is a
> bit of a mix, but under TOS and MagiC it's a dial-up stack.

How come? STiNG has the same functionality under TOS, MiNT and MagiC.

> Who mentioned LAN's here? Throw LAN out, it is not invited in this
> discussion, wrong topic.

Actually, a lot of people use their Atari in a LAN, either because they
have several Ataris or because they use their PC as a gateway to the net.

>>as you claim, you're forced to buy MagiC to use them. What if you want to
>>use EMailer, but also like to use memory-protection and Paral when you
>>program? Dual-boot?
> Perhaps, why not :-) I can claim exactly the same. I'm forced to install
> MiNTNet and if I want to use Emailer what are the options? Dual-boot?

If ASH had used a different network-API you could have used EMailer under
STiNG, I-Connect, MiNT-Net and Draconis... And btw., why are you forced to
install MiNT-Net? Because I-Connect doesn't support anything else than one
single point-to-point connection over a modem...

Btw2. STiNG also supports your network-card.

If ASH really wanted the IConnect *API* to be the standard they would have released the specs to the public so we can write wrappers for the free stacks. But they're not interested in that - they're just interested in selling MagiC. Just look at e.g. Emailer: To be sure that it can *only* be used under MagiC it looks specifically for MagiC and not just for the needed functionality.

>>and use tin, knews or something similar. They're not pretty, but very fast
>>and very functional.
> Is that a pig flying by? No, you're really serious aren't you? On average
